1.0 Introduction

Ashland Inc. (Ashland) is submitting this Phase II report for the Resource Conservation and Recovery Act (RCRA) facility investigation (Phase II RFI) at Ashland Distribution Company facility (Facility) located in Clearfield, Utah. The report has been prepared in accordance with the corrective action portion of Ashland's RCRA permit – Module IV (Section IV.E: parts IV.E.1 and IV.E.2) and the Phase II RCRA Facility Investigation Work Plan (hereafter referred to as Phase II RFI Work Plan - URS, 2005) approved by UDEQ in a May 3, 2005 correspondence. The Phase II RFI Work Plan was submitted as an addendum to the Phase I RCRA Facility Investigation Workplan (URS, 2000, and URS, 2002 - Phase I RFI Workplan). The Phase II RFI Work Plan utilized the same methodologies as reported in the Phase I RFI Workplan.

1.1. PURPOSE

A Phase I RFI report was submitted to UDEQ on January 24, 2003. Based on UDEQ's September 22, 2004 comment letter on the Phase I RFI and a letter dated February 14, 2005, further sampling was indicated for tetrachloroethylene (PCE) at Solid Waste Management Units SWMU) 2 (Product Storage Tank Farm), 3 (Product Loading/Unloading Area), 5 (Railcar Unloading Area), and 7 (Waste Collection Tank Area). No additional investigation was indicated for SWMUs 1 (Solvent Recovery Sump), 8 (Waste Storage Tank), or 9 (Neutralization Unit Area). UDEQ requested in correspondence dated May 3, 2005 that a risk assessment or clean closure plan be submitted for SWMU 4 (Container Filling Area/Drumming Room) relevant to benzo(a)pyrene [B(a)P] and dibenz(a,h)anthracene [D(a,h)A] in soil and for SWMU 10 (Hazardous Waste Storage Area) relevant to PCE in soil.

Accordingly, the purpose of the Phase II RFI was to conduct further sampling for PCE in soil at SWMUs 2, 3, and 5 and in groundwater at SWMU 7. No additional sampling and analysis was conducted for B(a)P and D(a,h)A or for PCE in soil at SWMU 10 during the Phase II RFI. This Phase II RFI report includes sufficient information to support the risk-based closure of SWMUs 2, 3, 4, 5, 7, and 10.

2.0 Description of Current Conditions

Information concerning the Facility history, land use, regional and local geology and hydrogeology, and nature and extent of constituents detected in environmental media is presented in the following documents previously filed with the UDEQ: a Description of Current Conditions at Ashland Chemical's Clearfield, Utah Facility (Woodward-Clyde, 1997), the RCRA Facility Assessment (RFA) Report (UDEQ, 1999), the Phase I RFI Workplan and Addendum (URS, 2000 and 2002), and the Phase I RFI Report (URS, 2003). Pertinent information from these reports and several published sources is summarized below.

2.1 GENERAL FACILITY INFORMATION

The Facility is located on 6.5 acres within an industrial park (Freeport Center) in the south half of Section 2, Township 4 North, Range 2 West (Salt Lake Base and Meridian) in the extreme northern part of Freeport Center. The Facility is located within the city of Clearfield, in Davis County, Utah (Figure 1). The geographical location of the Facility is 41° 6.294' North latitude and 112° 2.150' West longitude.

2.1.1 Facility History

The Facility and the Freeport Center Industrial Park were undeveloped until the early 1940s, when the Navy developed the property for use as a supply depot. The Navy operated the Freeport Center until about 1963. During the approximately 20 years of Naval ownership and use, there were a variety of operations employing potentially hazardous materials. According to a study prepared for the Freeport Center (Dames & Moore 1989), the Naval operations included 75 underground storage tanks for fuel oil and gasoline, gas stations, above-ground fuel tanks, transformer stations, and flammable materials storage. Currently, no information about actual products managed has been available, except for the above noted general type of products that were handled at the depot.

The Navy Supply Depot was purchased by the Freeport Center Associates in 1963 and developed into a manufacturing, distributing, and warehousing industrial park. The Freeport Center includes more than 7 million feet of warehousing space on more than 650 acres. Dozens of businesses have established facilities at the Freeport Center, although from 1963 to 1982 (when Ashland took occupancy) only one tenant (A&K Railroad) other than the Navy previously occupied the property now used by Ashland.

Historically, during the period that the Facility property was part of the Navy Supply Depot and/or A&K Railroad's operations, there is minimal documentation as to whether spills or releases occurred. Therefore, undocumented spills or releases of potentially hazardous substances may have occurred prior to Ashland's occupancy of the Facility. In fact, there is evidence that degradation of groundwater had taken place prior to startup of Ashland's operations at the Facility. A report by Dames & Moore (1982) documented elevated concentrations of phenols, total organic carbon, and halogenated compounds in a groundwater sample collected from a well on the extreme upgradient side of the Facility. However, it is unknown what caused this groundwater contamination.

According to the Dames & Moore study from 1982, a release of product occurred during removal of an underground storage tank (UST) that was located 200 feet east and upgradient of a monitoring well MW-2 at the northeast corner of the Facility. The UST was reportedly punctured during removal operations and a large volume of the contents spilled back into the excavation. The excavation was backfilled and graded over. The type of product spilled was not disclosed, nor were volume estimates provided of product lost to the subsurface.

According to Mr. Stephen Barrett, General Manager of the Freeport Center, the Facility known as Building 12 and currently occupied by Ashland was used by the Navy as a railroad engine roundhouse (Woodward-Clyde 1997). Railroad tracks still present on the south side of the Facility formerly extended into a large bay in Building 12, inside of which the Navy performed maintenance on the engines. There is no historical documentation available describing this work. It is unclear how waste from these operations was disposed.

A&K Railroad Salvage (A&K) occupied the Building 12 property from 1963 until 1982. As reported in the Analytical Results Report, A&K Railroad (UDEQ March 4, 1999), A&K occupied a significantly larger parcel of property that that currently occupied by Ashland. According to Mr. Barrett, A&K refurbished railroad materials at the site during these years. Specific information concerning the processes employed by A&K are not available, but there were fuel tanks on the property and railroad ties have been reported to have been stored in the western portions of the property. Also, as noted in the 1999 UDEQ report, buildings, parking lots, and roadways cover approximately 80 percent of the former A&K surface area and that Building 12 is the only surficial remnant of the A&K facility. This report also points out that reported observations of historic A&K operations indicate that solvents were allowed to contact the unlined ground surface over an extended period of time. The Davis County Health Department received complaints of livestock deaths in 1970 from contaminated water in an area approximately 3 miles south of the Freeport Center near a storm sewer outfall. Health Department Inspectors traced the contamination back to a "frothy-green" water in the storm drains within Freeport Center boundaries. The source of this contamination was thought to be from oily residues from A&K and/or chromate solutions from a metal plating facility (UDEQ/DERR, 1995). Soil and groundwater sampling and analysis was conducted to evaluate the A&K property, however, no samples were collected on the portion of the property currently occupied by the Facility. The 1997 Site Inspection at the A&K Railroad site detected levels of polyaromatic hydrocarbons (PAHs) in all of the samples (including: benzo(b)fluoranthene, B(a)P, and D(a,h)A above residential, and below occupational health based screening values available at the time). Groundwater samples were also obtained outside the premises of the Facility. Groundwater samples were collected from a depth of 30 feet below ground, far below the sampling interval for groundwater obtained during the Facility RFI. Surface water and sediment samples were obtained and showed detections of trichlorobenzene, 4-chlor-3-methylphenol, 2-4-dicholorbenzene, and/or PAHs. These results indicate that PAHs and other contaminants were existent in environmental media prior to Ashland's operations at the facility (as all samples were collected outside the portion of the A&K Railroad site that is occupied by the Facility).

2.1.2 Current Facility Operations

The Facility is currently a chemical distribution operation where bulk chemicals brought to the Facility are repackaged for distribution to industrial and commercial users in the Utah area. Bulk solvents are received at the Facility by tank truck and railcar for storage in the product tank farm (Figure 2). Identified SWMUs are shown on Figure 3. Solvents are drummed, blended, and resold in bulk or less-than-truckload quantity. No chemical manufacturing is done at this Facility.

Mixed solvent residual products are recovered from transfer hoses, pumps, and blend tanks when switching between products. The recovered solvents are placed in 55-gallon drums and segregated into product classes (nonhalogenated light products, nonhalogenated heavy products, and halogenated products). Recovered solvents are either sold for beneficial use or shipped off site to a solvent reclaimer or a waste disposal firm.

Hazardous waste is also stored on the Facility in accordance with the Facility's RCRA permit. The waste comes in the form of spent solvent returned from Ashland customers for temporary storage until it is shipped off site for disposal. Historically, spent solvent was stored in drums in the hazardous waste storage area (SWMU #10) or in a bulk storage tank in the waste storage area (SWMU #8). Hazardous waste management has been transferred to the recently permitted new hazardous waste storage area.

2.2 LAND USE INFORMATION

Demographics of this part of Utah's Front Range of the Wasatch Mountains are changing. There is significant population growth on the east shore of the Great Salt Lake, including in the Clearfield area. Industries are moving into the area and residential housing is also displacing agriculture on land once dedicated to crops. The Freeport Center was, before development in the early 1940s, a farming and ranching area. While the lands east of the Freeport Center have been developed for some time, rural zones west of the Freeport Center and Clearfield are increasingly being developed. The Facility itself is bordered on all sides by industries of the Freeport Center. The closest residence is estimated to be ¾ mile from the Facility.

2.2.1 Topography

Figure 1 illustrates the topography at the Facility and the surrounding area. The Facility and surrounding industrial park lie on relatively flat terrain. Elevations on site range from about 4,408 feet above mean sea level (msl) to approximately 4,400 feet msl. The topographic trend for the Facility reflects a regional pattern. The Facility rests in the Great Salt Lake Valley basin, on alluvial and colluvial sediments eroded from the Wasatch Mountains to the east. Elevations are therefore higher toward the mountains to the east, gradually decreasing toward the Salt Lake Valley to the west. The Facility slope is similar with highest elevations on the east side and lowest elevations on the west.

2.2.2 Regional Geology and Hydrogeology

Unconsolidated, fine grained, lacustrine sand, silt, and clay material, which originally eroded from the Wasatch Mountains, comprise the soil beneath the Freeport Center area. However, it is

believed that the surficial material at the Facility consists primarily of fill material, which was imported to the Freeport Center area at an undetermined time. Two borings drilled at the Facility (Dames and Moore 1982) show that approximately two to four feet of fill material is present (Figure 4). These borings were later completed as wells MW-1 and MW-2 (Figure 5). Based on the boring logs, the fill material typically consists of light brown, fine sandy silt, silty fine and coarse gravel with some fine and coarse sand. Underlying the fill are silts with some clay and fine sand, or clayey silt to about 5 to 6.5 feet below grade. MW-2, in the northeast portion of the Facility, encountered silty clays from about 5 feet to approximately 20 feet below grade, with some thin layers of intervening fine sand. Below this layer were fine sands with small amounts of silt that extended to boring completion at about 28.5 feet below grade. MW-1, on the southwest portion of the Facility, encountered silty, very fine sands grading with thin layers of silt and clay to about 14 feet below grade. From 14 feet to about 19 feet below grade, silty clays were encountered with interbedding layers of fine sand. From about 19 feet to 31 feet below grade, silty fine sands with thin silty clay seams were logged.

Two principal hydrogeologic units are present below the Facility. A shallow unconfined aquifer is reported to range from approximately 10 feet to about 25 feet below grade in this area (USGS 1972). A deeper, confined aquifer exists below the unconfined aquifer, and can be very prolific, having typical yields of 500 to 1,000 gallons per minute (gpm), sometimes achieving yields as high as 4,000 gpm. The deeper aquifer exists under artesian conditions, with potentiometric pressures sufficient to produce flowing wells. The deeper aquifer is found at depths greater than 400 feet below grade.

The unconfined shallow aquifer is predominantly comprised of silty fine sands and fine sandy silts, with significant heterogeneity of interbedded layers of clay, silt, and sand (Dames and Moore 1989), and is consistent with materials encountered in the two site borings. Water levels measured in wells MW-1 and MW-2 have ranged from about 5 feet below grade to about 12 feet below grade. The unconfined groundwater flow is reported to have a gradient of about 0.01 feet/feet (Dames and Moore 1989, USGS 1972). Shallow groundwater flow direction for the unconfined aquifer below the Facility is inferred east-northeast to west-southwest, following the topography.

2.3 RECEPTOR INFORMATION

There are no significant surface water drainages in the vicinity of the Facility. The largest stream in the area is the Weber River, located approximately four miles to the north and east of the Freeport Center. Surface water that falls as precipitation at the Facility infiltrates to the subsurface, or is captured in stormwater collection systems for discharge. The discharge is permitted and monitored by UDEQ (Permit UTR 000222). There are no designated wetlands near the Facility (USFWS, 1997). The primary wetland and waterfowl habitat in the area is adjacent to the east shore of the Great Salt Lake. Some intermittently saturated marshlands are approximately three miles west of the Facility. The Howard Slough State Waterfowl Management Area is more than four miles west of the Facility.

A number of threatened, endangered, and sensitive (TES) species are known to occur or nest along the Front Range of the Wasatch Mountains, including the bald eagle (*Haliaeetus*

leucocephalus), but there are no known special status or sensitive species within one mile of the Facility (Woodward-Clyde, 1997). One Utah sensitive species is known to occur in this area. The western snowy plover (*Charadrius alexandrinus*) nests on the beach shorelines of the Great Salt Lake. The nearest known nesting site for a western snowy plover is about eight miles west of the Facility.

The Ashland Facility is part of a large manufacturing and industrial storage complex (Freeport Center) and is expected to remain as an industrial use area in the future. Access to the Facility is restricted by a chain-link fence. Therefore, potential human receptor populations now and in the future include Ashland on-site workers, contract construction workers, or authorized visitors. Access to the Facility is restricted; therefore, exposure is limited to personnel working at the Facility and individuals permitted to enter the area. Most of the Facility has been covered with concrete mitigating the potential for exposure to environmental media. There are no residential areas in the immediate vicinity. The closest residence is estimated to be ¾ mile from the Facility.

Human exposure to groundwater emanating from the Facility is unlikely since there are no shallow, domestic-use groundwater wells in the vicinity. A water rights search of the vicinity showed only seven groundwater wells within one mile downgradient (west to southwest) from the Facility. The seven downgradient wells have the key features and uses shown on Table 1. Figure 6 shows the location of these wells with respect to the Facility. Only wells numbered 2 and 3 withdraw water from the shallow unconfined aquifer for irrigation purposes. The remainder of the wells (with the exception of well number 2 and 3) are screened at depths greater than 400 feet deep in the deep confined aquifer.

3.0 Variances to Work Plan

The site investigation was performed in general accordance with the Work Plan (URS, 2005). The site investigation was discussed with UDEQ staff (Ms. Connie Rauen) who was present during the Phase II RFI implementation and collected three split soil samples (BHA-2, BHC, and BG002).

3.1 FIELDWORK SCHEDULE

Environmental drilling began on June 24, 2005, after submittal of the Work Plan on April 20, 2005 and approval of the Work Plan by UDEQ on May 3, 2005.

4.0 Subsurface Facility Investigation

4.1 SCOPE OF INVESTIGATION

The scope of field work for this Phase II RFI included the following:

- The completion of five soil borings, collection of soil samples, and chemical analysis of soil samples for PCE at SWMUs 2, 3, 5, and 7; and
- The collection and chemical analysis of groundwater samples for PCE from a soil boring at SWMU 7.

A detailed discussion of field methods can be found in the UDEQ approved Phase I RFI Workplan. A detailed discussion of the sampling network design, the rationale for drilling soil borings, and collecting soil and groundwater samples can be found in the UDEQ approved Phase II RFI Work Plan.

4.1.1 Project Target Parameters

Per the Phase II RFI Work Plan, the soil and water samples were analyzed for PCE. The analytical methods and method detection limits for the specified parameters are presented in Tables 2 and 3.

4.1.2 Data Quality Objectives

Data Quality Objectives (DQOs) are qualitative and quantitative statements that specify the quality of the data required to support decisions made during investigative activities. Since DQOs are based on the end uses of the data collected, different data uses may require different levels of data quality. Data quality indicators were calculated during the independent data validation and data validation codes were assigned to laboratory results as appropriate. Data precision, accuracy, completeness, representativeness, and comparability were assessed according to provisions of the SAP and appropriate SOPs.

4.2 PHYSICAL GEOLOGY

The discussion of the physical geology at the site is based on previous work (Dames & Moore, 1982) and the 16 soil borings completed during the Phase I RFI (Figure 7); no changes to the physical geology description are necessary based on the Phase II RFI. Boring logs for the Phase II RFI soil borings are included in Appendix A. Analytical soil and groundwater laboratory data are included in Appendix B and physical soil data is summarized in Table 4. A Quality Assurance Review was completed as specified in the Work Plan.

A variety of unconsolidated soil types underlie the Facility. Two geologic cross sections have been prepared to depict the Facility geology. The locations of the cross sections are shown on Figure 8. Some degree of filling has occurred across the industrial park and the Facility property. The fill material was imported to the Freeport Center at an undetermined time and ranges from 2.0 to 3.5 feet of gravelly sand and sandy gravel mixtures or concrete. Underlying the fill material are several native soil types, including clay, silt, sand, and gravel. The clay (silty

clay) soil appears to be continuous across the entire Facility (Figures 9 and 10). The silt (clayey silt) soil type appears to extend across the majority of the site; where it is absent, it is replaced by the silty clay soil. The top of the clayey silt is typically found between two and five feet below grade and is typically between two and five feet thick. The top of the silty clay is found between two and ten feet below grade and is typically between five and 17 feet thick. Only monitoring wells MW-1 and MW-2 penetrated the silty clay. Monitoring MW-1 encountered a fine-grained silty sand and MW-2 encountered a fine-grained sand with a trace of silt.

4.3 PHYSICAL HYDROGEOLOGY

The water table across much of the site is relatively flat, and occurs within silt or silty sand deposits beneath the fill. The depth to groundwater is typically between three and six feet below grade. The elevation of the water table is typically between 4,403 and 4,404 feet above msl.

The soil borings were not installed for a sufficient period of time to allow the water level in the soil borings to reach equilibrium; therefore a site-specific groundwater flow direction and gradient have not been calculated. Groundwater is inferred to flow to the southwest to west-southwest, toward the Great Salt Lake. The unconfined shallow aquifer present beneath the Facility is reported to have a gradient of 0.01 feet/feet (Dames and Moore 1989, USGS 1972).

4.4 SUMMARY OF ANALYTICAL RESULTS: RFI PHASES I AND II

UDEQ indicated that constituents of concern (COCs) requiring further evaluation in the Phase II RFI were as follows:

- PCE in soil at SWMUs 2, 3, 5, and 10
- PCE in groundwater at SWMU 7
- D(a,h)A and B(a)P at SWMU 4

The soil and groundwater results for these constituents from the Phase I RFI and the Phase II RFI are described in this section. Figures 11 and 12 spatially depict the soil concentrations of detected compounds and Figure 13 spatially depicts the groundwater concentrations of detected compounds.

In the Phase I RFI, soil results were evaluated relative to USEPA's generic soil screening levels (SSLs) in a manner consistent with Utah Regulation R315-101-5, Health Evaluation Criteria, Risk Assessment. Actual land use conditions and exposure scenarios were identified for the facility, as described in R315-101-5.2 (b)(2). Subsurface soil pathways identified as potentially complete in the conceptual site model (CSM) for construction workers included incidental ingestion, inhalation of dust and volatiles, and dermal contact. The CSM was comparable to the USEPA's SSL scenarios for commercial and industrial settings for outdoor workers and the assumptions used for the calculation of the generic SSLs. Soils analytical results were compared to generic USEPA SSLs in a manner consistent with Utah Regulation R315-101-5 (for pathways including: ingestion-dermal, inhalation of volatiles, inhalation of fugitive particulates and, as a conservative measure, migration to groundwater using a dilution attenuation factor [DAF] of 20).

Similarly, groundwater analytical results from the Phase I RFI were compared to USEPA maximum concentration limits (MCLs) and Utah Groundwater Standards listed under R317-6-2. Since the MCLs are equal to or less than the Utah standards, or the Utah standards have not been formulated for all compounds with an MCL, only the MCLs are listed in this report.

4.4.1 Soil

The soil boring locations for the Phase I and II RFI investigations are shown on Figure 7. A MiniRAE Plus photoionization detector (PID) with a 10.6 eV lamp was used to field screen selected headspace samples. The laboratory analytical samples were collected from intervals selected in the Phase II RFI Work Plan. The recorded headspace values are presented in Table 5 and included on the individual boring logs (Appendix A).

During the Phase II RFI field work, a total of nine soil samples (including one duplicate sample) were collected from five sample locations. Analytical results for the Phase II investigation are provided in Appendix B; a summary of results is provided in Tables 6 and 7. Phase I and II RFI analytical results are grouped with their respective SWMU and summarized below relative to the COCs (i.e., PCE for SWMUs 2, 3, 5, 7, and 10 and D(a,h)A and B(a)P for SWMU 4).

SWMU #2 Product Storage Tank Farm

Phase I Investigation

During the 2002 RFI sampling soil boring AC-BH002 was completed at the southeast corner of the product storage tank farm and waste storage tank areas, near a secondary containment sump drain line, to a depth of six feet below grade. Samples were collected from 4.0 to 5.0 feet below grade. PCE was detected at a concentration of 100 ug/kg with a "J" flag for concentrations below the quantification limit. The 100 ug/kg "J" concentration exceeded the Migration to Groundwater generic SSL of 60 ug/kg for PCE.

Soil boring AC-BH003 was completed at the southwest corner of the product storage tank farm, near a secondary containment drain line, to a depth of seven feet below grade. Samples were collected for VOC, SVOC, metals, and cyanide laboratory analysis from 2.0 to 4.0 feet below grade and 6.0 feet below grade. PCE was not detected in the sample.

Soil boring AC-BH002 was completed at the southeast corner of SWMU 2. PCE was detected in the soil sample from four to five feet below grade at a concentration of 100 ug/kg with a "J" flag, which indicates that the result was an estimated value below the reporting limit. Using information from surrounding Phase I RFI sampling locations, PCE was detected inAC-BH007 (15 feet south of AC-BH002) at a similar depth at a concentration of 4.1 ug/kg with a "J" flag. PCE was also detected in AC-BH016 (40 feet northeast of AC-BH002) at a concentration of 1.9 ug/kg with a "J" flag. PCE was not detected in AC-BH001 (20 feet south-southwest of AC-BH002) with a detection limit of 5.6 ug/kg. PCE was not detected in AC-BH003 (over 80 feet west ofAC-BH002) with a detection limit of 5.4 ug/kg.

The horizontal extent of the PCE at SWMU 2 was defined in the Phase I RFI. The Phase II WP recommended that the AC-BH002 location be resampled and analyzed for PCE to verify the

reported concentration of 100 ug/kg with a "J" flag. A sample was also planned from the seven to eight feet interval.

Phase II Investigation

During the 2005 Phase II RFI sampling, soil boring AC-BH002 was resampled at the 4.0 to 5.0 feet below grade to confirm the "J" flag result from 2002 and sampled in the 7.0 to 8.0 feet below grade to evaluate the vertical extent of impacts. PCE was below method detection limits in both samples.

SWMU #3 Product Loading/Unloading Area

Phase I Investigation

Soil boring AC-BH004 was completed near the center of the product loading/unloading area by the northernmost floor drain beneath the truck rack canopy, to a depth of 12 feet below grade. Samples were collected from 2.5 to 4.5 feet below grade. PCE was below the generic SSLs.

Soil boring AC-BH005 was completed near the easternmost floor drain beneath the truck rack canopy to a depth of 12 feet below grade. Samples were collected for laboratory analysis from 5.0 to 6.0 feet below grade. PCE was detected at a concentration of 300 ug/kg, which exceeded the migration to groundwater generic SSL of 60, (but was below the ingestion-dermal and inhalation SSLs).

Soil boring AC-BH006 was completed near the southernmost floor drain beneath the truck rack canopy, to a depth of 12 feet below grade. Samples were collected for laboratory analysis from 2.5 to 3.5 feet below grade. PCE was below the generic SSLs.

Soil boring AC-BH005 was completed in the north central part of SWMU 3. PCE was detected in the soil sample from five to six feet below grade at a concentration of 300 ug/kg. Consideration of information from surrounding Phase I RFI sampling locations was used to determine a sampling approach for the Phase II RFI. PCE was detected in AC-BH010 (34 feet east-northeast of AC-BH005) at a similar depth at a concentration of 53 ug/kg with a "J" flag. PCE was not detected in AC-BH006 (10 feet west of AC-BH005) at a depth of 2.5 to 3.5 feet below grade at a detection limit of 5.6 ug/kg. PCE was not detected in AC-BH004 (12 feet northwest of AC-BH005) at a depth of 2.5 to 4.5 feet below grade at a detection limit of 6.1 ug/kg. PCE was not detected in AC-BH012 (28 feet southeast of AC-BH005) at a depth of 6.0 to 7.5 feet below grade at a detection limit of 6.1 ug/kg. PCE was not detected in AC-BH001 (24 feet northeast of AC-BH002) with a detection limit of 5.6 ug/kg.

Borings were proposed to the north (BH-A) and south (BH-B) of AC-BH005 (within approximately 20 feet radius ofAC-BH005 and at the edge of concrete) from one to two feet below grade and five to six feet below grade to evaluate the horizontal/vertical migration potential.

Phase II Investigation

During the 2005 Phase II RFI, soil boring BH-A was completed approximately 20 feet north of AC-BH005. Samples were collected for PCE laboratory analysis from the 1.0 to 2.0 feet below grade and 5.0 to 6.0 feet below grade. PCE was detected in the 1.0 to 2.0 feet below grade sample at a concentration of 0.28 ug/kg with a "J" flag. PCE was not detected in the 5.0 to 6.0 feet below grade sample, or in a blind duplicate, both with detection limits of 0.20 ug/kg.

During the 2005 Phase II RFI, soil boring BH-B was completed approximately 20 feet south of AC-B005. Samples were collected for PCE laboratory analysis from the 1.0 to 2.0 feet below grade and 5.0 to 6.0 feet below grade. PCE was detected in the 1.0 to 2.0 feet below grade sample at a concentration of 0.20 ug/kg with a "J" flag. PCE was not detected in the 5.0 to 6.0 feet below grade sample, or in a blind duplicate, both with detection limits of 0.21 ug/kg.

SWMU #4 Container Filling Area (Drumming Room)

Phase I Investigation

Soil boring AC-BH007 was completed to the southwest of the westernmost floor drain of the drumming room, to a depth of six feet below grade. Samples were collected for laboratory analysis from 3.5 to 4.5 feet below grade. A duplicate sample was also submitted. D(a,h)A and B(a)P were not detected in the samples.

Soil boring AC-BH008 was completed adjacent to the center floor drain of the drumming room, to a depth of six feet below grade. Samples were collected for analysis from 3.5 to 4.5 feet below grade. B(a)P, detected at a concentration of 930 ug/kg, exceeded the ingestion-dermal SSL of 200 ug/kg (but was below the migration to groundwater SSL). D(a,h)A was detected at a concentration of 370 ug/kg, which exceeded the ingestion-dermal SSL of 200 (but was below the migration to groundwater SSL).

Soil boring AC-BH009 was completed adjacent to the easternmost floor drain of the drumming room, to a depth of eight feet below grade. Samples were collected for laboratory analysis from 3.0 to 4.0 feet below grade. D(a,h)A and B(a)P were not detected.

Soil boring AC-BH010 was completed to the south of the drumming room, to a depth of 12 feet below grade. Samples were collected for laboratory analysis from 4.0 to 6.0 feet below grade. No individual VOCs exceeded the generic SSLs. D(a,h)A and B(a)P were not detected.

In summary, AC-BH008 was completed in the center of SWMU 4 within a sump that contained a concrete-closed former drain line. B(a)P and D(a,h)A were detected at concentrations of 930 and 370 ug/kg, respectively. Consideration of other borings sampled during the Phase I investigations showed that B(a)P and D(a,h)A were not detected in any of the five other borings (BH001, AC-BH002, AC-BH007, AC-BH009, and AC-BH010) that surround AC-BH008 and were located within 20 feet of AC-BH008. Detection limits in AC-BH001, AC-BH002, AC-BH007, and AC-BH009 were 330 ug/kg for both compounds. Detection limits inAC-BH010 were 400 ug/kg for both compounds.

Phase II Risk Assessment Approach

UDEQ requested further investigation of B(a)P and D(a,h)A at SWMU 4 based on the results of the Phase I RFI. However, the horizontal extent of the B(a)P and D(a,h)A impacts have been defined as described above by existing soil borings. From a site-specific perspective, the concrete floor of SWMU 4 effectively mitigates potential exposure to the compounds and further intrusive investigation would reduce the integrity of the concrete floor/cap. Finally, PAHs are not, nor have ever been, a constituent handled at the facility. UDEQ requested a risk assessment in compliance with permit Condition IV.J or a plan for clean closure by removal of the contamination, in compliance with permit Condition IV.I for B(a)P and D(a,h)A at SWMU 4 . A risk assessment is included in this report as Section 5.

SWMU #5 Railcar Unloading Area

Phase I Investigation

Soil boring AC-BH011 was completed adjacent to a former sump associated with the railcar unloading area, to a depth of 12 feet below grade. Soil samples were collected from 6.0 to 7.0 feet below grade. PCE was below the generic SSLs.

Soil boring AC-BH012 was completed adjacent to a former sump associated with the railcar unloading area, to a depth of 12 feet below grade. Soil samples were collected for VOC laboratory analysis from 6.0 to 7.5 feet and 9.0 feet below grade. PCE was below the generic SSLs.

Soil boring AC-BH013 was completed adjacent to a former sump associated with the railcar unloading area, to a depth of 12 feet below grade. Soil samples were collected for laboratory analysis from 3.5 to 4.0 feet and 12 feet below grade. PCE was detected at a concentration of 290 ug/kg in the 12 feet below grade sample, which exceeded the migration to groundwater generic SSL of 60 ug/kg (but was below the ingestion-dermal and inhalation SSLs).

Soil boringAC-BH013 was completed in the eastern portion of SWMU 5. PCE was detected in the soil samples from 3.5 to 4.0 feet below grade (5.8 ug/kg) and from 12 feet below grade (290 ug/kg with a "J" flag). Consideration of other borings sampled during the Phase I investigations showed that PCE was detected inAC-BH010 (80 feet west ofAC-BH013) at four to six feet below grade at a concentration of 53 ug/kg with a "J" flag. PCE was also detected inAC-BH009 (75 feet northwest ofAC-BH013) at three to four feet below grade at a concentration of 1.9 ug/kg with a "J" flag. PCE was not detected in AC-BH012 (85 feet west of AC-BH013) at depths of 6.0 to 7.5 feet and 9.0 feet with a detection limit of 6.1 ug/kg. The Phase II RFI Workplan included borings at approximately 20 feet west (BH-C) and south (BH-D) of AC-BH013 at the 11 to 12 feet below grade.

Phase II Investigation

During the 2005 Phase II RFI, soil boring BH-C was completed approximately 20 feet west of AC-BH013. Samples were collected for PCE laboratory analysis from the 11.0 to 12.0 feet below grade. PCE was not detected in the 11.0 to 12.0 feet below grade sample with a detection limit of 33 ug/kg.

During the 2005 Phase II RFI, soil boring BH-D was completed approximately 20 feet south of AC-BH013. Samples were collected for PCE laboratory analysis from the 11.0 to 12.0 feet below grade. PCE was not detected in the 11.0 to 12.0 feet below grade sample with a detection limit of 33 ug/kg.

SWMU #10 Hazardous Waste Storage Area

Phase I Investigation

Soil boring AC-BH016 was completed adjacent to the central floor drain of the hazardous waste storage area, to a depth of 12.0 feet below grade. Soil samples were collected for laboratory analysis from 3.5 and 8.0 feet below grade. PCE was detected at a concentration of 200 ug/kg in the 3.5 feet below grade sample, which exceeded the migration to groundwater generic SSL of 60 ug/L (but was below the generic ingestion-dermal and inhalation SSLs).

Soil Boring AC-BH016 was completed in the center of SWMU 10 immediately adjacent to a former drain line that had been concreted closed. PCE was detected at a concentration of 200 ug/kg with a "J" flag at a depth of 3.5 feet below grade and below detectable levels (less than 8 ug/kg) at eight feet below grade. Consideration of other Phase I RFI sampling locations showed that PCE was detected in AC-BH009 (38 feet south-southwest of AC-BH016) at three to four feet below grade at a concentration of 1.9 ug/kg with a "J" flag. PCE was also detected in AC-BH002 (43 feet southwest of AC-BH016) at four to five feet below grade at a concentration of 100 ug/kg with a "J" flag. Vertical definition of PCE in SWMU 10 was achieved in the Phase I RFI.

Phase II Risk Assessment Approach

UDEQ requested further investigation of PCE impacts as part of the Phase II RFI. However, vertical definition of the extent of PCE was achieved in the Phase I RFI. No further investigation was proposed in the Phase II RFI. From a site-specific perspective, use of the area for hazardous waste storage has been discontinued, the concrete surface of SWMU 10 effectively mitigates the potential for exposure to PCE in soil and migration of PCE in soil to groundwater, and further intrusive investigation will reduce the integrity of the concrete warehouse floor/cap. UDEQ requested a risk assessment in compliance with permit Condition IV.J or a plan for clean closure by removal of the contamination, in compliance with permit Condition IV.I for PCE in soil at SWMU 10. A risk assessment is included in this report as Section 5.

4.4.2 Groundwater

The Phase II groundwater investigation was limited to further evaluation of PCE detected at SWMU 7. Groundwater sampling results from RFI Phase I and II for SWMU 7 are discussed below. Analytical results are included in Appendix B. A summary of the chemical results for groundwater and a comparison to the MCLs are presented in Table 8.

SWMU #7 Waste Collection Tank Area

Phase I Investigation

Soil boring AC-BH014 was completed within the former waste collection tank (SWMU #7) basin. A grab groundwater sample was collected from the boring. PCE was detected in the water sample at a concentration of 6.1 micrograms per liter (ug/L), slightly above the 5.0 ug/L USEPA MCL. Considering samples collected at other borings during the Phase I RFI shows that PCE was also detected in the water sample from AC-BH007 (60 feet east of AC-BH014) at a concentration of 0.97 ug/L with a "J" flag. PCE was not detected in the water sample from AC-BH001 (50 feet east of AC-BH014) with a detection limit of 1.0 ug/L. PCE was not detected in the water sample from AC-BH003 (30 feet northwest of AC-BH014) with a detection limit of 1.0 ug/L. Grab samples provide conservative information compared to a traditionally purged groundwater sample. It would be expected that such data would provide results that would be higher than what would be expected from a well. Perched ground water was only sporadically encountered across the site as detailed in the Phase I RFI Report. The Phase II RFI Workplan included groundwater sampling at a location between SWMU 7 and monitoring well MW-1 (BH-E) to verify the detection at AC-BH014.

Phase II Investigation

During the 2005 Phase II RFI, soil boring BH-E was completed approximately 40 feet west of AC-BH014. A water sample was collected from approximately 12 to 16 feet below grade and analyzed for PCE. PCE was not detected in the water sample from 12 to 16 feet below grade sample, including a blind duplicate, both with detection limits of 0.20 ug/L.

4.4.3 Investigative Derived Waste

Consistent with historical practice, investigative derived waste (IDW) was thinspread on site.

5.0 RISK ASSESSMENT

As outlined in Section IV.J of the Hazardous Waste Permit for the Facility (UDEQ, 1997), a human health risk assessment (HHRA) using standard and actual exposure scenarios may be used to support the risk-based closure option provided in Section IV.E.9 of the Permit. This section presents the results of an HHRA for the Facility based on the actual exposure scenario (i.e., industrial land use conditions). Detailed information describing the methodology used to evaluate risk at the Facility is provided in Appendix D.

There is no pathway by which terrestrial or aquatic biota could come into contact with SWMU-related chemicals because the Facility is located in a commercial/industrial area, the SWMUs are generally in areas that are covered with pavement or structures, and. In addition, in Section 2.5 of the Phase I RFI Report (URS Diamond, 2003), there are no wetlands near the Facility and the nearest known nesting site for a Utah sensitive species (western snowy plover) is about eight miles west of the Facility. Therefore, an ecological assessment is not warranted for the Facility and a waiver of the requirement for an ecological assessment of the Facility is therefore requested by Ashland. Section 2.5 of the Phase I RFI Report provides additional detailed information concerning the lack of available ecological habitat as well as the lack of threatened, endangered and sensitive species at the Facility (URS Diamond, 2003).

5.1 CONCEPTUAL SITE MODEL

A conceptual site model (CSM), for the Facility is presented below in Figure 14. The CSM outlines:

- Potential contaminant sources
- Potential release mechanisms
- Potentially affected media
- Potential migration pathways
- Potential human receptors

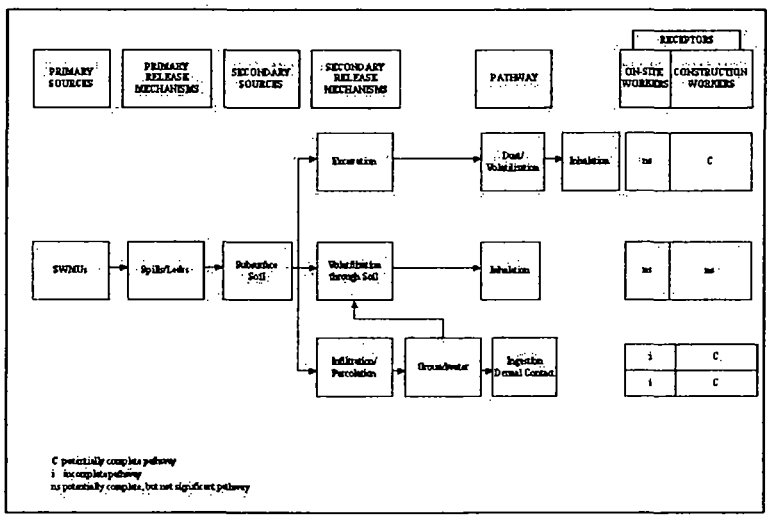

Figure 14: Conceptual Site Model for the Ashland Clearfield Facility

5.2 AREAS OF INTEREST

The areas of interest for the Facility are based on the results of the Phase I and Phase II RFI investigations and along with communication between UDEQ and Ashland (UDEQ, 2004; UDEQ, 2005a; UDEQ, 2005b). The results of the soil and groundwater investigation are summarized below. Only those SWMUs and COCs identified by UDEQ as requiring further evaluation subsequent to the Phase I RFI were evaluated further in this risk assessment. UDEQ indicated that COCs requiring further evaluation in the Phase II RFI were as follows:

- PCE in soil at SWMUs 2, 3, 5, and 10
- PCE in groundwater at SWMU 7
- D(a,h)A and B(a)P at SWMU 4

Detailed information regarding the soil and groundwater investigations are provided in the Phase I RFI Report (URS-Diamond, 2003) and this Phase II RFI Report.

5.2.1 Soil Investigation Results

The text below summarizes the Phase I and Phase II sampling results for PCE, B(a)P, and D(a,h)A at each SWMU investigated. Sampling locations for the borings discussed are shown on Figure 11. The detailed sampling results for each of these SWMUs are provided in Section 4.5.

5.2.1.3 Sampling Results for PCE in Soil

PCE was detected below SSLs for direct contact exposure (i.e., ingestion/dermal and inhalation of volatiles) in all soil samples, but above the generic migration-to-groundwater SSL with a dilution attenuation factor of 20 (DAF*20) in the following four sample locations during the Phase I RFI:

- SWMU 2 (Product Storage Tank Farm) – Boring AC-BH002,
- SWMU 3 (Product Loading/Unloading Area) – Boring AC-BH005,
- SWMU 5 (Railcar Top Unloading Stations) – AC-BH013, and
- SWMU 10 (Hazardous Waste Storage Area) – AC-BH016.

However, during the Phase II RFI, sampling conducted in PCE levels were not found above detection levels and/or at levels very near the limit of detection. Each of the samples were well below the SSLs.

5.2.1.2 Sampling Results for B(a)P and D(a,h)A in Soil

B(a)P and D(a,h)A were detected in soil samples above the SSLs for direct contact exposure (i.e., incidental ingestion and dermal pathways) at SWMU 4. A single sample, AC-BH008 (at 3.5 to 4.5 feet below grade) showed B(a)P and D(a,h)A at 930 and 370 ug/kg, respectively. These compounds were not detected in any of the five Phase I RFI borings (BH001, AC-BH002, AC-BH007, AC-BH009, and AC-BH010) that surround AC-BH008 and are located within 20 feet of AC-BH008. Additional sampling was not conducted for SWMU 4 during the Phase II RFI.

5.2.2 Groundwater Results

One compound, PCE was detected above the MCL in one sample during the Phase I RFI. PCE was detected above the MCL of 5.0 ug/L in one groundwater sample at a concentration of 6.1 ug/L at SWMU 7 boring AC-BH014 (Figure 13). PCE was not detected in samples collected during the Phase II RFI.

5.3 AREAS EVALUATED FOR THE HHRA

Further analysis of the Phase I and II RFI results has been conducted to provide a risk assessment to support closure of the Facility areas identified by UDEQ as requiring further evaluation subsequent to the Phase I RFI. These SWMUs include:

- SWMU 2 – PCE in soil
- SWMU 3 – PCE in soil
- SWMU 4 – B(a)P and D(a,h)A in soil
- SWMU 5 – PCE in soil
- SWMU 7 – PCE in groundwater
- SWMU 10 – PCE in soil

The only constituents identified as potential chemicals of concern (PCOCs) for the SWMUs and evaluated in this HHRA are PCE, B(a)P and D(a,h)A. Site-specific land use shows a hypothetical construction worker scenario as the primary direct contact exposure scenario for the property relative to the subsurface (i.e., below paved Facility areas) constituent detections.

5.4 HHRA RESULTS

5.4.1 B(a)P and D(a,h)A in Soil (SWMU #4)

As provided in the CSM presented in Section 5.1, B(a)P and D(a,h)A at SWMU #4 were evaluated assuming a construction worker exposure to excavated soil in the area defined by sample locations AC-BH001, AC-BH002, AC-BH007, AC-BH008, AC-BH009, and AC-BH010. Detected concentrations and a proxy concentration of one-half the sample quantitation limit (SQL) for non-detects were used to calculate a 95% upper confidence limit of the arithmetic mean (UCL) in soil of all depths using USEPA's ProUCL software (USEPA, 2003). This UCL was compared to the maximum detected concentration at all soil depths and the lesser of the two concentrations was selected as the exposure point concentration (EPC) to be used for evaluating risk. Detailed information regarding the calculation of the EPC and risk calculations is provided in Appendix D.

Table 9 shows that the estimated carcinogenic risk for a construction worker receptor potentially exposed to B(a)P and D(a,h)A at all soil depths is 5E-08, which is below UDEQ's criterion risk level of 1E-06 for a risk-based closure. This finding demonstrates that concentrations detected would not be expected to present an unacceptable risk to human health, indicating that SWMU #4 can be petitioned for NFA status.

5.4.2 PCE in Soil

PCE in soil was evaluated for SWMU #s 2, 3, 5, and 10. Figure 3 shows that these SWMUs are located adjacent to one another and were evaluated as a single unit. This unit includes the following sample locations.

- SWMU #2: AC-BH001, AC-BH002, AC-BH003, AC-BH007, AC-BH016
- SWMU #3: AC-BH004, AC-BH005, AC-BH006, BH-A, BH-B
- SWMU #5: AC-BH010, AC-BH012, AC-BH013, BH-C, BH-D
- SWMU #10: AC-BH002, AC-BH009, AC-BH016

Carcinogenic risk and noncarcinogenic hazard was also calculated using the maximum detected PCE concentration for the Facility. This second calculation was completed to demonstrate the upper-bound values for SWMU-specific risks. Detailed information regarding the calculation of the EPC and risk calculations is provided in Appendix D.

Table 10 shows the risks associated with the construction worker receptor exposed to PCE at all soil depths are 2E-08 (based on the Facility-wide EPC) and 3E-08 (based on the maximum detected PCE concentration at all SWMUs), which are below UDEQ's criterion risk level of 1E-06. This finding demonstrates that concentrations detected would not be expected to present an unacceptable risk to human health.

5.4.3 PCE in Water

Groundwater is not utilized at the Facility for potable or any other purposes. Site-specific land use shows a hypothetical construction worker scenario as the primary direct contact exposure scenario for the property relative to the subsurface (i.e., below paved Facility areas) constituent detections. PCE in groundwater was evaluated relative to detection of 6.1 ug/L in a single grab groundwater sample at AC-BH014. The result at AC-BH014 was greater than the USEPA MCL and Utah Drinking Water Standard of 5 ug/L. However, no other sample results were found above the MCL for PCE (or for any other VOC during the Phase I and II RFI).

Potential carcinogenic risk and noncarcinogenic hazard associated with exposure to groundwater was evaluated for the construction worker using the maximum detected groundwater concentration detected at the Facility. While conservative, the maximum detected concentration was used because there is no defined plume and the available data do not warrant a statistical calculation. Detailed information regarding the calculation of carcinogenic and noncarcinogenic risks is provided in Appendix D.

Table 11 shows that the estimated carcinogenic and noncarcinogenic hazard are 1E-06 and 0.19, respectively. As indicated in Module IV.J.3, because the estimated carcinogenic risk is not greater than the UDEQ risk-based closure criteria of 1E-06 (for carcinogens) and a hazard index of one (for noncarcinogens), these findings demonstrate that concentrations detected would not be expected to present an unacceptable risk to human health.

5.4.4 HHRA Discussion and Conclusions

The HHRA indicates that the subsurface detections of PCE in soil at SWMUs 2, 3, 5, and 10 and in groundwater at SWMU 7 and the B(a)P and D(a,h)A in soil at SWMU 4 would not present an unacceptable risk for a construction worker scenario, the only potentially complete exposure pathway at the facility. The HHRA included conservative assumptions such that the estimated risk would be expected to be over-estimated as a protective measure.

Further analysis of the Phase I and Phase II RFI results shows that from a direct contact standpoint, the concentrations of PCE detected in soil would not be above generic USEPA SSLs for a long-term industrial or residential scenario. The maximum detected concentration of PCE in soil samples from the SWMUs was 300 ug/kg with a 95%UCL of 194 ug/kg compared to USEPA Region 9 Preliminary Remediation Goals (PRGs) of 1,300 ug/kg for an industrial worker scenario and 480 ug/kg for a residential scenario. The PCE levels are above the generic soil to groundwater migration SSL of 60 ug/kg (by a factor in the range of 3 to 5). The single detection of PCE above the MCL was only slightly above the standard at 6.1 ug/L versus the MCL of 5. However, Facility groundwater is not utilized for potable or other non-potable uses such that the exposure pathway is incomplete. The likelihood for migration of groundwater off-site to a depth or location where the pathway would be complete is negligible. Furthermore, incidental direct contact with groundwater was shown to be at acceptable risk levels for the most likely potential exposure pathway, that of a construction worker involved in subsurface excavation.

Further analysis of the B(a)P (maximum = 930 ug/kg) and D(a,h)A (maximum = 370 ug/kg) detected at SWMU 4 shows that the detections were found at subsurface samples, at 3.5-4.5 feet bgs. The levels detected were well below soil to groundwater migration SSLs (i.e., 8,000 ug/kg for B(a)P and 2,000 ug/kg for D(a,h)A]. From a soils direct contact perspective, if the SWMU 4 levels for these compounds are compared to the USEPA Region 9 PRGs (developed based on an incremental cancer risk of 1E-06 and conservatively assumed exposure parameters) for industrial and residential scenarios (i.e., 210 ug/kg and 62 ug/kg, respectfully, for industrial and residential for both compounds), the estimated risks for such long-term daily exposure scenarios for the maximum concentrations would be as follows:

	Industrial	Residential
B(a)P	4.6E-06	1.5E-05
D(a,h)A	1.8E-06	5.6E-06
Total Risk	6.4E-06	2.1E-05

Considering that the area where the maximum detection of the compounds was found is below a paved/concreted covering, the likelihood of exposure is negligible. Furthermore, incidental direct contact with soil was shown to be at acceptable risk levels for the most likely potential exposure pathway, that of a construction worker involved in subsurface excavation. Such compounds are ubiquitous in environmental media from natural and anthropogenic sources and

often found in fill material. Finally, as outlined in Section 2.1.1, these compounds were likely the result of historical operations at the A&K Railroad site and unrelated to Facility operations.

5.5 CONCLUSIONS

The HHRA demonstrates that the potential risk and/or hazard for a hypothetical construction worker for the case of exposure to soil or groundwater at the Facility is below UDEQ's criterion risk levels for the protection of human health. These finding demonstrate that concentrations detected would not be expected to present an unacceptable risk to human health.

6.0 Summary and Conclusions

The Phase I and II RFI results were evaluated to assess the soil and groundwater concentrations detected at the Facility. COCs were identified by comparing the soil and groundwater data to risk-based SSLs developed by USEPA in a manner consistent with Utah Regulation R315-101-5 (for pathways including: ingestion-dermal, inhalation-volatiles, inhalation of fugitive particulates and migration to groundwater-assuming a DAF of 20 fold). The groundwater analytical results were compared to USEPA MCLs and Utah Groundwater Standards listed under R317-6-2.

Subsequent to the Phase I RFI, UDEQ indicated that a Phase II RFI evaluation and risk assessment of the specified COCs would be required to support closure of the following SWMUs:

- PCE in soil at SWMUs 2, 3, 5, and 10
- PCE in groundwater at SWMU 7
- D(a,h)A and B(a)P at SWMU 4

The following summarizes conclusions of the Phase II RFI and Risk Assessment:

- The Facility's physical geology consists of a 2.0 to 3.5 feet thick layer of gravelly sand and sandy gravel mixtures or concrete. Underlying the fill material are several native soil types including clay, silt, sand, and gravel. The clay soil appears to be continuous across the entire Facility. The clayey silt appears to extend across the majority of the site; where it is absent it is replaced by the silty clay soil. The alluvial deposits do not appear to be laterally continuous.
- Groundwater is inferred to flow to the southwest to west-southwest, toward the Great Salt Lake. The unconfined shallow bearing zone, if present beneath the Facility, is reported to have a gradient of 0.01 feet/feet (Dames and Moore 1989, USGS 1972). The water table across much of the site is relatively flat, and occurs within silt or silty sand deposits beneath the fill. The depth to groundwater is typically between 3 and 6 feet below grade. The results indicate groundwater is associated with silt or silty sand deposits. The discontinuous nature of these deposits and the sporadic groundwater encountered is typical of perched conditions.
- There are no significant surface water drainages in the vicinity of the Facility. The largest stream in the area is the Weber River, located about four miles to the north and east of the Freeport Center. Surface water that falls as precipitation infiltrates to the subsurface, or is captured in stormwater collection systems for discharge in accordance with a UDEQ permit.
- The Quality Assurance Review indicated that the data are acceptable for project use.
- PCE was the only VOC detected in soils above the generic SSLs. PCE was detected at concentrations ranging from 100 to 300 ug/kg that were above the generic SSL of 60 ug/kg for migration to groundwater in four soil borings: AC-BH002, AC-BH005, AC-BH013, and AC-BH016 (Figure 11). PCE did not exceed the ingestion-dermal or inhalation SSLs in any soil samples. The PCE detected at 4 to 5 feet below grade in AC-

BH002 was near the secondary containment sump drain line in the product storage tank farm/waste storage tank areas (SWMU #2/8). The PCE detected at 5 to 6 feet below grade in AC-BH005 was at the area beneath the easternmost floor drain beneath the truck rack canopy in product loading/unloading area (SWMU #3). The PCE detected at 12 feet below grade in AC-BH015 was beneath the easternmost former sump associated with the railcar unloading area, SWMU #5. The PCE detected at 3.5 feet below grade in AC-BH016 was at the central floor drain within the hazardous waste storage area (SWMU #10).

- Results of Phase II RFI resampling at AC-BH002 in 2005 showed no detection of PCE. Four additional soil borings completed in the Phase II RFI at AC-BH005 and AC-BH-13 showed detections below and/or very near to the detection level.
- The results of the HHRA for PCE in soil are less than UDEQ's risk criterion of 1E-06 for a risk-based closure.
- B(a)P and D(a,h)A were the only SVOC compounds detected in soil above the generic SSLs. The two compounds were detected above the generic soil ingestion-dermal SSLs in one soil sample from the Container Filling Area (SWMU #4 – Boring AC-BH007) at 930 ug/kg B(a)P and 370 ug/kg D(a,h)A. The generic ingestion-dermal SSLs are 200 ug/kg for both substances. The detections were at 3.5 to 4.5 feet below grade in AC-BH008 within SWMU 4 near the central floor drain (Figure 12). These compounds were below detection in all other Phase I samples (no further samples were collected during the Phase II RFI). The results of the HHRA for B(a)P and D(a,h)A showed estimated risks below UDEQ's criterion risk level of 1E-06 for a risk-based closure.
- No VOCs were detected in groundwater above MCLs with the exception of one sample, which exceeded the MCL for PCE. PCE was detected at SWMU 7 in a single grab groundwater sample collected from AC-BH014 at a concentration of 6.1 ug/L, slightly above the 5.0 ug/L MCL. During the Phase II RFI, groundwater samples were obtained at boring BH-E, completed approximately 40 feet downgradient from AC-BH014 in 2005. The concentration of PCE was below detectable levels.
- There is little to no potential for off-site environmental degradation from the Facility and there is no evidence that releases or spills from the Facility have migrated off-site. Facility activities are constrained by the fenced enclosure. Additionally, exposure relative to the constituents detected at the Facility are mitigated by their subsurface location and the concrete capping over the majority of the Facility where activities occur. The hydrogeological conditions which exist at the Facility serve to further limit migration and exposure pathways.
- There are no designated wetlands near the Facility (USFWS, 1997). The primary wetland and waterfowl habitat in the area is adjacent to the east shore of the Great Salt Lake. Some intermittently saturated marshlands are approximately three miles west of the Facility. The Howard Slough State Waterfowl Management Area is more than four miles west of the Facility.
- There are no known special status or sensitive species within one mile of the Facility although a number of TES species are known to occur or nest along the Front Range of the Wasatch Mountains, including the bald eagle (*Haliaeetus leucocephalus*),

(Woodward-Clyde, 1997). The nearest known nesting site for the only Utah sensitive species known to occur in the area (the western snowy plover) is about eight miles west of the Facility.

- There is little potential for human exposure to constituents detected in soil. Most of the property has been covered with concrete or buildings, so the potential for exposure to Facility employees or visitors is mitigated. Also, there are no residential areas in the immediate vicinity. The closest residence is estimated to be ¾ mile from the Facility.
- Human exposure to constituents detected in groundwater at the Facility is unlikely since there are no shallow, domestic-use groundwater wells in close proximity to the Facility. Only two wells withdraw water from the shallow unconfined aquifer and they are over ½ mile downgradient of the Facility. The discontinuous nature of the alluvial deposits further reduces likelihood of Facility activities impacting the wells that utilize the shallow unconfined aquifer. The remainder of the wells in the Facility vicinity (with the exception of the two irrigation wells) withdraw water from depths greater than 400 feet deep.
- The HHRA indicates that subsurface detections of PCE in soil at SWMUs 2,3,5, and 10 and in groundwater at SWMU 7 and the B(a)P and D(a,h)A in soil at SWMU 4 would not present an unacceptable risk for a construction worker scenario, the only potentially complete exposure pathway at the facility. The HHRA included conservative assumptions such that the estimated risk would be expected to be over-estimated as a protective measure. From a direct contact standpoint, the concentrations of PCE detected in soil would not be above generic USEPA SSLs for a long-term industrial or residential scenario or a construction worker scenario. As outlined in Section 2.1.1, B(a)P and D(a,h)A were likely the result of historical operations at the A&K Railroad site and unrelated to Facility operations. Nevertheless, considering that the area where the maximum detection of the compounds was found is below a paved/concreted covering, the likelihood of exposure is negligible.
- As indicated in Module IV.J.3, because estimated carcinogenic risk is not greater than 1E-06 and the estimated noncarcinogenic hazard is no greater than one, constituents in soil and groundwater underlying the property meets the criteria for a no further action designation for closure of the Facility's SWMUs.

In summary, the limited detections of analytes in the Facility soil and groundwater were only marginally above the conservative and generic SSLs and have been determined to be below UDEQ's criterion risk levels. The subsurface depth to the detections, the discontinuous geologic and hydrogeologic conditions, and the concrete covering over the majority of the Facility prevent and mitigate potential exposure pathways. No evidence of offsite impacts was encountered. Overall, the investigation demonstrated that site conditions at the Facility do not pose an unacceptable risk to human health or the environment.

7.0 Recommendations

Based on the results of the Phase I and II RFI and Facility-specific human health risk assessment, no further action is warranted for the Facility. The recommendations are planned to support the no further action designation and to support a request for closure of this investigation:

- Complete a no further action (NFA) petition for the open SWMUs per Ashland's RCRA permit – Module IV (Section IV.H: part IV.H.1).
- Obtain a waiver of the ecological assessment requirement based on the lack of sensitive species and habitats as described in Section 2.

Table 1
Downgradient Well Summary
Ashland Inc. / Clearfield DSO

Map Number	Owner	Use	Depth (feet bgs)
1	LDS Church	Domestic Stockwatering	115
2	Christine Medler	Irrigation	30
3	Michael Moyes	Irrigation	20
4	City of Syracuse	Municipal Supply	777
5	City of Syracuse	Municipal Supply	943
6	City of Syracuse	Municipal Supply	400
7	City of Syracuse	Municipal Supply	628

Notes:
bgs = Below ground surface

Table 2
Volatile Organic Compound Parameter List, Quantification Limits, and Methods
Ashland Inc. / Clearfield DSO

Analyte	Soil (µg/kg)			Water (µg/l)		
	MDL	Proposed RL	Actual RL Range	MDL	Proposed RL	Actual RL Range
Tetrachloroethene	1.29	5	5.4 - 300	0.36	1	1 - 1

Method = USEPA SW-846 Method 8260B

Specific detection and reporting limits are highly matrix dependent. The method detection limits (MDL) and reporting limits (RL) listed herein are provided by STL of Arvada, Colorado, for guidance and may not always be achievable.

Reporting limits listed for soil are based on wet weight.

Reporting limits calculated by the laboratory for soil, calculated on dry weight basis, will be higher.

-- Compound not analyzed for in this matrix.

Table 3
Semivolatile Organic Compound Parameter List, Quantification Limits, and Methods
Ashland Inc. / Clearfield DSO

Analyte	Soil (µg/kg)			Water (µg/l)		
	MDL	Propoded RL	Actual RL Range	MDL	Proposed RL	Actual RL Range
Benzo(a)pyrene	47.2	330	330 - 420	1.73	10	10 - 250
Dibenz(a,h)anthracene	51.7	330	330 - 420	2.21	10	10 - 250

Method = USEPA SW-846 Method 8270C

Specific detection and reporting limits are highly matrix dependent. The detection limits and reporting limits listed herein are provided by STL of Arvada, Colorado, for guidance and may not always be achievable.

Reporting limits listed for soil are based on wet weight.

Reporting limits calculated by the laboratory for soil, calculated on dry weight basis, will be higher.

-- Compound not analyzed for in this matrix.

Table 4
Summary of Physical Soil Data
Ashland Inc. / Clearfield DSO

Soil Boring Location	Depth Below Ground (feet)	% Gravel	% Sand	%Silt	% Clay	Unified Soil Classification System	% Solids
BH003	4.5-6.0	47.3	45.1	5.4	2.2	GM	96.2
BH011	6.0-7.0	0.0	0.6	56.3	43.1	CL	84.1
BH015	10.0-12.0	1.0	24.2	43.8	31.0	CL	84.2

Table 5
Soil Boring Headspace Screening Results Summary
Ashland Inc. / Clearfield DSO

	Soil Boring Location	Depth Below Ground (feet) 0-2	2-4	4-6	6-8	8-10	10-12	12-14	14-16
Phase II RFI	BH-A	0.0	4.0	9.5	NA	28.0	32	--	--
	BH-B	0.0	1.0	4.0	3.8	--	--	--	--
	BH-C	NA	0.8	NA	5.1	30.0	50	--	--
	BH-D	0.0	3.1	NA	5.8	40.0	135	--	--
	BH-E	3.8	2.5	3.1	4.5	8.0	4.1	10.1	5.1
	BH002 (2005)	3.1		4.1	5.1	25.1	--	--	--

Headspace readings were assigned to the closest two foot interval.
Headspace readings in parts per million.
NA = No headspace reading available for the interval.
-- = Interval is deeper than boring termination.

APPENDIX B
Laboratory Analytical Reports

Quality Assurance Review
Ashland Inc.
Distribution Services Organization
Clearfield, Utah
June 24, 2005

The following is the quality assurance/quality control (QA/QC) review performed for eight soil and three groundwater samples collected at the Ashland Inc. DSO facility in Clearfield, Utah June 24, 2005. Sampling personnel collected the soil samples using EnCore™ samplers using EPA Method 5035. STL Inc. of Arvada, Colorado analyzed the samples for tetrachloroethene using EPA Method 8260B. URS performed the QA/QC review following EPA guidelines (USEPA, 1999).

Holding Time Review
All samples were extracted, prepared and analyzed within the required method holding times.

Blank Review
The lab analyzed one trip blank, one equipment blank, and two laboratory method blanks with these samples. Tetrachlorethene was not detected in the trip, equipment, or laboratory method blanks above the reporting limit.

Laboratory Control Sample (LCS) Review
The laboratory spiked LCS samples with known concentrations of several VOCs. URS reviewed the LCS recoveries to evaluate analytical accuracy.

All LCS recoveries were within laboratory control limits, indicating acceptable analytical accuracy.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD)
The laboratory spiked MS/MSD samples with known concentrations of several VOCs. URS reviewed MS/MSD recoveries and relative percent differences (RPDs) to evaluate analytical accuracy and precision.

All MS/MSD recoveries and RPDs were within laboratory control limits, indicating acceptable analytical accuracy and precision, and that the sample matrix did not have an effect on the analyses.

Surrogate Review
The laboratory spiked surrogates into all field samples, trip blanks, method blanks, LCS samples, and MS/MSD samples. Samples were spiked with 4-bromofluorobenzene, 1,2-dichloroethane-d4, and toluene-d8 as surrogates. The surrogate recoveries were reviewed to evaluate sample-specific accuracy.

All surrogate recoveries were within laboratory control limits, indicating acceptable sample-specific analytical accuracy.

Mass Spectral Tune

URS reviewed the mass spectrometer to evaluate whether the analytical instrumentation was operating properly.

All mass spectral tunes meet method specific criteria.

Instrument Calibration

URS reviewed instrument calibrations to determine that the correct concentrations of tetrachloroethene was measured.

All initial and continuing calibrations were within acceptable QC limits.

Internal Standards

URS evaluated internal standard areas and retention times for tetrachloroethene to determine instrument sensitivity and stability.

All internal standard areas and retention times were within acceptable QC limits.

Reporting Limits

URS reviewed analytical data to identify results reported as non-detect at elevated reporting limits.

QA/QC Summary

The QA/QC review indicated that the data are acceptable for the purpose of evaluating potential impacts of tetrachloroethene in soil and groundwater at this site.

Case Narrative

The results included in this report have been reviewed for compliance with STL's Quality Assurance/Quality Control (QA/QC) plan. The test results shown in this report meet all requirements of NELAC and any exceptions are noted below.

This report may include data with reporting limits (RLs) less than STL's standard reporting limit. These data and reporting limits are being used specifically to meet the needs of this project. Note that, data are not customarily reported to these levels without qualifiers, because they are inherently less reliable and potentially less defensible than the latest industry standards require.

Dilution factors and footnotes have been provided to assist in the interpretation of the results. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interferences or analytes present at concentrations above the linear calibration curve, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

STL utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameters listed on the analytical methods summary page in accordance with the methods indicated. A summary of quality control parameters is provided below.

Quality Control Summary for Lot D5F250124

Sample Receiving

- STL Denver received nine soils and four aqueous samples on June 25, 2005.
- The cooler temperature at receipt was acceptable at 2.6°C.
- All sample containers were received in acceptable condition.

Holding Times

- All analysis was performed within the required holding times.

Method SW846 8260B, GC/MS Volatle Organic Analysis (prep batch 5187161)

- A MS/MSD could not be analyzed for the batch due to insufficient sample volume. A Duplicate Laboratory Control Sample was analyzed to provide evidence of batch precision.
- No other anomalies were observed.

Method SW846 8260B, GC/MS Volatle Organic Analysis (prep batch 5186179)

- The percent recoveries (%R) and relative percent differences (RPD) for the client requested MS/MSD performed on sample D5F250124-008 (BH-E-1216) were within control limits.
- No anomalies were observed.

Method SW846 8260B, GC/MS Volatle Organic Analysis (prep batch 5181482)

- A MS/MSD could not be analyzed for the batch due to insufficient sample volume. A Duplicate Laboratory Control Sample was analyzed to provide evidence of batch precision.
- No other anomalies were observed.

Method MCAWW 160.3, Percent Moisture Analysis

- The RPD for the Method Duplicate performed on sample D5F250124-002 (BH-D-1112) was in control.
- No anomalies were observed.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

FORM 5
VOLATILE ORGANIC INSTRUMENT PERFORMANCE CHECK
BROMOFLUOROBENZENE (BFB)

Lab Name: STL-DENVER Contract:

Lab Code: Case No.: 5181482 SAS No.: 8260B SDG No.: D5F250124

Lab File ID: G3230 BFB Injection Date: 06/28/05

Instrument ID: G BFB Injection Time: 1413

GC Column: HP624 ID: 0.32 (mm) Heated Purge: (Y/N) N

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE	
50	15.0 - 40.0% of mass 95	20.9	
75	30.0 - 60.0% of mass 95	47.6	
95	Base Peak, 100% relative abundance	100.0	
96	5.0 - 9.0% of mass 95	7.3	
173	Less than 2.0% of mass 174	0.6	(0.8)1
174	50.0 - 100.0% of mass 95	77.4	
175	5.0 - 9.0% of mass 174	6.3	(8.1)1
176	95.0 - 101.0% of mass 174	75.0	(96.8)1
177	5.0 - 9.0% of mass 176	4.7	(6.3)2

1-Value is % mass 174 2-Value is % mass 176

THIS CHECK APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS, AND STANDARDS:

Sample I.D. No. and Description (Containers for each sample may be combined on one line)	Date	Time	Matrix: Air	Aqueous	Sed.	Soil	Containers & Preservatives: Unpres.	H2SO4	HNO3	HCl	NaOH	ZnAc/NaOH	8260B PCE only	Temperature	Special Instructions/ Conditions of Receipt
AC-BH002-0708	6-24-05	1240				X	4						X		PCE ONLY
TEMP BLANK				X			1							X	

Possible Hazard Identification
☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☒ Unknown

Sample Disposal
☐ Return To Client ☒ Disposal By Lab ☐ Archive For _____ Months (A fee may be assessed if samples are retained longer than 1 month)

Turn Around Time Required
☐ 24 Hours ☐ 48 Hours ☐ 7 Days ☒ 14 Days ☐ 21 Days ☐ Other _____

QC Requirements (Specify)

1. Relinquished By	Date: 6-24-05	Time: 1300	1. Received By	Date: 6/25/05	Time: 0830
2. Relinquished By	Date:	Time:	2. Received By	Date:	Time:
3. Relinquished By	Date:	Time:	3. Received By	Date:	Time:

Comments

DISTRIBUTION: WHITE - Returned to Client with Report; CANARY - Stays with the Sample; PINK - Field Copy

STL Denver

Sample Receiving Checklist

Lot #: D5F250124 Date/Time Received: 6/25/05

Company Name & Sampling Site: ASHLAND Clearfield UT

PM to Complete This Section: *Yes* ☐ *No* ☑ Residual chlorine check required: ☐

Yes ☐ *No* ☑ Quarantined :

Quote #: 65347

Special Instructions:

En Cores - LAB pres. within 48 hours

Time Zone:
• EDT/EST • CDT/CST • MDT/MST • PDT/PST • OTHER

Unpacking Checks:

Cooler #(s): 1

Temperatures (°C): 2.6

N/A	*Yes*	*No*		*Initials*
☐	☑	☐	1. Cooler seals intact? (N/A if hand delivered) If no, document on CUR.	
	☒	☐	2. Chain of custody present? If no, document on CUR.	
	☐	☑	3. Bottles broken and/or are leaking? If yes, document on CUR.	
	☐	☒	4. Multiphasic samples obvious? If yes, document on CUR.	
	☑	☐	5. Proper container & preservatives used? (ref. Attachment D of SOP# DEN-QA-0003) If no, document on CUR.	
☒	☐	☐	6. pH of all samples checked and meet requirements? If no, document on CUR.	
	☒	☐	7. Sufficient volume provided for all analysis requested? (ref. Attachment D of SOP# DEN-QA-0003) If no, document on CUR, and contact PM before proceeding.	
	☐	☒	8. Did chain of custody agree with labels ID and samples received? If no, document on CUR.	
☐	☒	☐	9. Were VOA samples without headspace? If no, document on CUR.	
☐	☒	☐	10. Were VOA vials preserved? Preservative ☒HCl ☐4±2°C ☐Sodium Thiosulfate ☐ Ascorbic Acid	
	☐	☒	11. Did samples require preservation with sodium thiosulfate?	
☒	☐	☐	12. If yes to #11, did the samples contain residual chlorine? If yes, document on CUR.	
☒	☐	☐	13. Sediment present in dissolved/filtered bottles? If yes, document on CUR.	
☒	☐	☐	14. Is sufficient volume provided for client requested MS, MSD or matrix duplicates? If no, document on CUR, and contact PM before proceeding.	
	☐	☒	15. Receipt date(s) > 48 hours past the collection date(s)? If yes, notify PA/PM.	
	☒	☐	16. Are analyses with short holding times requested?	
	☐	☒	17. Was a quick Turn Around (TAT) requested?	

STL Denver

Sample Receiving Checklist

Lot # DSF 250124

Login Checks: *Initials* AW

N/A	Yes	No		
	☑	☐	18. Sufficient volume provided for all analysis requested? (ref. Attachment D of SOP# DEN-QA-0003)	If no, document on CUR, and contact PM before proceeding.
☑	☐	☐	19. Is sufficient volume provided for client requested MS, MSD or matrix duplicates?	If no, document on CUR, and contact PM before proceeding.
	☑	☐	20. Did the chain of custody includes "received by" and "relinquished" by signatures, dates, and times?	
☐	☑	☐	21. Were special log in instructions read and followed?	
☑	☐	☐	22. Were AFCEE metals logged for refrigerated storage?	
	☑	☐	23. Were tests logged checked against the COC? Which samples were confirmed? All	
☑	☐	☐	24. Was a Rush form completed for quick TAT?	
☐	☑	☐	25. Was a Short Hold form completed for any short holds?	
	☐	☑	26. Is "Strict ICOC" required?	
	☐	☑	27. Were special archiving instructions indicated in the General Comments?	If so, what were they?

Labeling and Storage Checks: *Initials* JB

☑	☐	☐	28. Was the subcontract COC signed and sent with samples to bottle prep?
	☑	☐	29. Were sample labels double-checked by a second person?
☐	☐	☐	30. Were sample bottles and COC double checked for dissolved/filtered metals by a second person?
	☑	☐	31. Did the sample ID, Date, and Time from label match what was logged?
☑	☐	☐	32. Were stickers for special archiving instructions affixed to each box and to the ICOC? See #27
☑	☐	☐	33. Were AFCEE metals stored refrigerated?
☑	☐	☐	34. Were "Strict ICOC" copies given to satellite storage areas?

Document any problems or discrepancies and the actions taken to resolve them on a Condition Upon Receipt Anomaly Report (CUR).

APPENDIX D
Human Health Risk Assessment Methodology

APPENDIX D
HUMAN HEALTH RISK ASSESSMENT METHODOLOGY

The purpose of the human health risk assessment (HHRA) for the Ashland Clearfield facility (the Facility) is to provide a risk-based interpretation of the data collected during the Phase I and II Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) and to provide conservative estimates of potential human health risks posed by chemicals that are present in environmental media at the Facility. The data collected during implementation of the Phase I RFI Work Plan (URS Diamond, 2000) and Phase II RFI Work Plan (URS Diamond, 2005) were used to develop the HHRA for the solid waste management units (SWMUs) at the Facility.

1.0 OVERVIEW

In accordance with the Utah Department of Environmental Quality (UDEQ) guidance for Cleanup Action and Risk-Based Closure Standards (Utah Administrative Code [UAC] R315-101), the methodology for developing the HHRA follows guidance presented in the *Risk Assessment Guidance for Superfund: Vol. I Part A – Human Health Evaluation Manual* ("RAGS, Part A", USEPA, 1989) and several more recent regulatory guidance documents and resources as appropriate such as:

- *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (OSWER 9355.4-24, December 2002) (USEPA, 2002a)
- *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual, Part E, Supplemental Guidance for Dermal Risk Assessment* ("RAGS, Part E", USEPA/540/R/99/005, OSWER 9285.7-02EP, PB99-963312, July 2004) (USEPA, 2004a)
- *Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites* (OSWER 9285.6-10 December 2002) (USEPA, 2002b)

The approach for developing an HHRA for the Facility incorporated the following fundamental components:

- Data Evaluation
- Exposure Assessment
- Toxicity Assessment
- Risk Characterization
- Uncertainty Analysis

As discussed in Section 3.1.1 of the Phase I RFI Work Plan (URS Diamond, 2000), the HHRA was completed using actual exposure scenarios defined for the Facility.

The HHRA focuses on SWMUs, environmental media and constituents of concern (COCs) identified by UDEQ as requiring further evaluation subsequent to the Phase I RFI (per UDEQ's September 22, 2004 and February 14, 2005 correspondence). The Phase I RFI included a

detailed screening risk assessment and served to identify COCs in specific environmental media as Facility SWMUs. UDEQ indicated that COCs requiring further evaluation were as follows:

- Tetrachloroethylene (PCE) in soil at SWMUs 2, 3, 5, and 10
- PCE in groundwater at SWMU 7
- Dibenz(a,h)anthracene (D[a,h)A) and benzo(a)pyrene (B[a]P) at SWMU 4

Therefore, the HHRA will focus on data relative to these COCs collected during the Phase I and II RFI.

1.2 RISK ASSESSMENT

SWMUs containing chemical concentrations that exceed screening values (e.g. soil screening levels [SSLs] for soil and maximum contaminant levels [MCLs] for groundwater) require an HHRA as outlined in Section IV.J in the Hazardous Waste Permit for the Facility (UDEQ, 1997). The HHRA is a site-specific evaluation of a SWMU or a combination of several SWMUs. The evaluations included varying degrees of sophistication depending on the SWMU conditions and the nature and extent of impact as indicated below.

- If a SWMU or area poses a risk less than 1E-6 for carcinogens and a hazard index (HI) of less than 1 for noncarcinogens, then a No Further Action (NFA) petition is submitted to UDEQ.
- If the SWMU or area poses a cancer risk greater than 1E-6 for carcinogens, then the mitigation of potential risks are addressed using a Site Management Plan (SMP).
- If a SWMU or area poses a risk to human health greater than 1E-4 or an HI greater than one using the actual exposure scenario, then a Corrective Action Plan (CAP) is required.

2.0 DATA EVALUATION AND IDENTIFICATION OF CONSTITUENTS OF PRELIMINARY CONCERN

Presented in this appendix is detailed information regarding the approach that was used for developing an HHRA for the Facility.

2.1 DATA EVALUATION

One of the first steps of the HHRA process is to review data collected for previous investigations to develop a data set to support the Facility-specific HHRA. The analytical data from the Facility was reviewed to:

(1) Validate and organize sampling data that are of acceptable quality for their use in the detailed HHRA; and

(2) Identify COCs for the Facility.

Presented below is detailed information with respect to the methods that was used for the data quality evaluation.

2.2 DATA REVIEW PROTOCOL

The data review task included efforts related to the compilation of available analytical and field data for the Facility. The data from Phase I and Phase II RFIs were reviewed to:

- Identify the nature and extent of COCs; and
- Evaluate data usability, including any uncertainties associated with the data.

Described below is information relative to the methods that was used to develop a data set to support the development of the Facility-specific HHRA.

2.2.1 Qualified Data

Qualifiers pertaining to uncertainty in the identity or the reported concentration of an analyte may be assigned to certain analytical data by the laboratories or by persons performing data validation. Presented below is information with respect to the use of qualified data in the HHRA.

QUALIFIER	DEFINITION	USE OF QUALIFIED DATA IN HHRA?
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit (SQL).	If the analyte is selected as a COC, then it will be assumed to be present at one-half the SQL.
J	The analyte was positively identified; however, the associated numerical value is an estimate of the concentration of the analyte in the sample.	If the analyte is selected as a COC, it will be assumed to be present at the estimated concentration.

QUALIFIER	DEFINITION	USE OF QUALIFIED DATA IN HHRA?
UJ	The analyte was not detected above the reported SQL. However, the reported SQL is an estimate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	If the analyte is selected as a COC, then it will be assumed to be present at one-half the SQL.
R	The sample results are rejected and are, therefore, unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.	Data will be excluded from the quantitative HHRA.

2.2.2 Duplicate Results

Listed below are methodologies that were used to select the concentration term from duplicate analytical sampling results:

- If a chemical was detected in both samples, the average of measured concentrations was used as the concentration term.
- If a chemical was detected in one sample, then the measured concentration was selected as the concentration term, regardless of whether it was detected in the original or duplicate sample.
- If both duplicate samples were non-detect, then one-half of the lower reporting limit was adopted as the concentration term.

2.3 DATA TABULATION

The validated analytical results are presented in Tables 7 through 9 for soil and Tables 10 through 12 for groundwater in this Phase II RFI Report. Summary tables prepared in accordance with the format recommended in *RAGS, Part A* (USEPA, 1989), to present relevant statistical data, such as the frequency of detection, detection limits, the range of detected concentrations, the distribution of data set and the source term concentrations to be used in the HHRA are presented in Table D-1a and D-1b.

2.4 IDENTIFICATION OF PRELIMINARY CHEMICALS OF CONCERN

Although many chemicals might be identified in the environmental samples collected for RFIs, the results of an HHRA are often driven by a few chemicals and exposure pathways. To streamline the risk-based evaluation process, several methods have been developed by the regulatory agencies and the scientific community for the identification of chemicals and pathways that contribute significantly to the total risks posed by a site. For this Facility, only those chemicals with concentrations exceeding readily-available screening values (e.g., USEPA SSLs for soil and MCLs for groundwater) and inorganic background concentrations were evaluated further in the HHRA. This approach is outlined in Section IV.E of the Hazardous Waste Permit (UDEQ, 1997) and UAC R315-101. The detailed evaluation was provided in the

Phase I RFI (URS, 2003). Subsequent to the RFI, UDEQ identified the constituents PCE in soil and groundwater and B(a)P and D(a,h)A in soil as requiring further evaluation to support completion of the RFI. These compounds serve as the COCs selected for evaluation in the HHRA.

2.4.1 Risk-based Screening Approach

Evaluation of the data for the COCs from the Phase I and II RFI required development of appropriate exposure point concentrations (EPCs). The lesser of the maximum detected concentration and the 95% upper confidence limit of the arithmetic mean (95%UCL) of a chemical was selected as the EPC. The methodology used to calculate the 95% UCL is presented in the following paragraphs.

2.4.1.1 Calculation of 95%UCL

The approach used for computing the 95% UCL is consistent with the guidance provided in USEPA (2002b). The latest version of USEPA's ProUCL software was used as a tool for calculating the 95% UCL (USEPA, 2004b). ProUCL computes multiple statistics, and presents a recommendation for the appropriate exposure concentration. However, there are limitations to the application of ProUCL. Specifically, the currently available ProUCL does not consider nondetects in distribution testing and subsequent derivation of UCLs (although integration of nondetects is reportedly under development by USEPA). Therefore, manual modifications were made to the decision logic in ProUCL, which include the following:

- For purposes of calculating the 95% UCL, one-half of the SQL was adopted as surrogate values to represent nondetects.
- For data sets in which greater than 50% of the data are nondetects, non-parametric statistics were used to determine the 95% UCL, regardless of the value recommended in ProUCL.

Tables D-2 to D-5 present the output statistics generated by ProUCL.

3.0 EXPOSURE ASSESSMENT

Exposure assessment involves the identification of the potential human exposure pathways at the Facility based on the current and potential future land use scenarios. The exposure pathways link the sources, locations, types of environmental releases, and environmental fate with receptor locations and activity patterns. Generally, an exposure pathway is considered complete if it consists of the following four elements:

- A source and mechanism of release;
- A transport medium;
- An exposure point (i.e., point of potential contact with a potentially impacted medium); and
- An exposure route (e.g., ingestion) at the exposure point.

As outlined in Section 3.1.1 of the Phase I RFI Workplan, potential current and future use scenarios were presented. However, only complete exposure pathways were selected for a quantitative evaluation. Justifications for those scenarios and exposure pathways not evaluated in the HHRA are also provided in Section 3.1.1 of the Phase I Workplan (URS Diamond, 2000) and Section 5 of this report.

3.1 HUMAN HEALTH CONCEPTUAL FACILITY MODEL

The first step in the exposure assessment is to characterize areas to be evaluated in the HHRA with respect to its physical characteristics as well as those of the potential human populations at or near a site. Information gathered in this step will be used to support the identification and selection of exposure pathways that warrant further evaluation in the Facility-specific HHRA.

3.1.1 Known and Suspected Sources of COCs and Release Mechanisms

Based on information with respect to the history of the Facility and the results of the RFIs, the potential sources of COCs were primarily associated with past industrial operations. It is not clear that all constituent detections at the property are directly related to Facility operations alone as baseline environmental conditions were not determined for the beginning and end of the periods of use for all historical property owners and operators. Ashland leased the Facility in 1982 after the property was utilized for 40 years as part of a US Navy Supply Depot and more recently after 20 years as a railroad round house where locomotive servicing and repair was conducted. While the Facility has operated with close supervision from USEPA and UDEQ, previous operations at the property were conducted during timeframes when environmental practices and regulations were less formalized, if available or followed at all.

As to potential source and release mechanisms, the location and environmental media must be considered for the COCs. COCs were detected in subsurface soil and groundwater. Subsurface soil and groundwater may act as secondary sources of COCs through mechanisms such as leaching from soil to groundwater and wind and mechanical erosion of chemicals in soil (i.e., if subsurface soils are exposed during excavation).

3.1.2 Retention or Transport Media

Soil is the primary medium of interest, as direct releases to groundwater have not been demonstrated in the Phase I and II RFI. Dust could be considered a potential transport medium in the case where COCs in uncovered soil may become entrained in fugitive dust.

3.1.3 Transport Pathways

Further evaluation of release mechanisms and transport pathways on a SWMU-by-SWMU or a Facility-wide basis depending upon the exposure medium was conducted using the findings of the Phase I and II RFI. From a soils perspective, COCs were detected in subsurface soils and groundwater. Listed below are potential cross-media transfer mechanisms of COCs that can be conservatively identified:

- COCs in subsurface soil may enter groundwater.
- COCs in subsurface soil exposed during excavation activities may be transported to the atmosphere via volatilization or fugitive dust emission.

3.1.4 Receptors and Exposure Scenario

The Facility is part of a large manufacturing and industrial storage complex (Freeport Center) and is expected to remain as an industrial use area in the future. A chain-link fence restricts access to the Facility on a 24 hour basis. Facility access is limited by security protocols. The Facility and, more specifically, the SWMUs of interest, are paved or covered and do not contain subsurface structures (i.e., basements or crawlspaces where Facility visitors would work or enter into). Potential current and future human receptor populations include:

- Authorized visitors
- Ashland on-site workers
- Contract construction workers

The text below outlines the rationale for inclusion or exclusion of the potential receptors in the HHRA.

3.1.4.1 Potential Exposure to COCs in Soil and Groundwater

Industrial/Commercial Land Use Scenario: Authorized Visitors
Exposure is primarily limited to personnel working at the Facility and individuals permitted to enter the area. Risks to authorized visitors potentially exposed to soil or groundwater at the Facility would be less than those risks associated with on-site workers or construction workers because authorized visitors to the Facility would be present on a limited basis. In addition, visitors must wear appropriate personal protective equipment and follow the Facility's procedures regarding health and safety to mitigate the potential for exposure. In general, visitors would not be expected to come in contact with subsurface soils or groundwater at the SWMUs as groundwater is not utilized for potable or non-potable purposes and soils are covered or paved at

the Facility (i.e., the potential pathway is incomplete). Therefore, authorized visitors were not evaluated in the HHRA for the Facility.

Industrial/Commercial Land Use Scenario: Ashland On-site Workers

On-site workers are defined as current and future industrial/commercial employees who might be exposed to chemicals in surface soil or groundwater while performing non-intrusive, operational activities. Because SWMUs are generally covered by pavement and structures and groundwater at the SWMUs is not utilized for potable or non-potable purposes, exposure to surface soil and groundwater is considered incomplete. Workers are not involved in intrusive or subsurface activities. Therefore, there is no exposure to subsurface soil or groundwater (i.e., the potential pathway is incomplete). The on-site worker receptor was not quantitatively evaluated for the HHRA.

Industrial/Commercial Land Use Scenario: Contract Construction Workers

As indicated soils at the SWMUs are largely covered or paved and groundwater is not utilized for potable or non-potable purposes at the facility. Therefore, exposure to COCs in subsurface soil or groundwater would require subsurface intrusive or excavation activities for soils to be uncovered or groundwater to be encountered. It was conservatively assumed that construction activities could occur at the Facility and it is possible for construction workers to be exposed to COCs detected in subsurface soil and groundwater via incidental ingestion, inhalation, and dermal contact.

3.2 QUANTITATION OF CHEMICAL INTAKE

Integration of data gathered in the exposure assessment (i.e., the extent, frequency, and duration of exposure for the receptors) into a quantitative expression of chemical-specific intake is necessary to perform a quantitative HHRA.

The potential for human receptors to be exposed to COCs in environmental media through relevant routes of exposure (e.g., inhalation, ingestion and dermal contact) were evaluated. Exposure pathways considered not to be applicable, based on Facility-specific information, were excluded from the quantitative evaluation in the HHRA. Rationale for the elimination of exposure pathways are discussed in detail in Section 3.1.1 of the Phase I RFI Work Plan (URS Diamond, 2000) and summarized in Section 3.1.4 of this appendix.

Described below is the basic equation used to calculate the intake of COCs by human receptors (USEPA, 1989):

$$DI = \frac{C \times IR \times EF \times ED}{BW \times AT}$$

Where:

DI	=	Daily intake (mg of chemical per kg of body weight per day)
C	=	Concentration of a COC (e.g., mg/kg in soil, mg/L in water)
IR	=	Intake rate; the amount of impacted medium contacted over the exposure period (e.g., mg/day for soil, L/day for water and m^3/day for air)
EF	=	Exposure frequency; describes how often exposure occurs (days/year).
ED	=	Exposure duration; describes how long exposure occurs (years).

BW = Body weight; the average body weight over the exposure period (kg)
AT = Averaging time; period over which exposure is averaged (days)

Each of the intake variables in the above equation consists of a range of values in the literature. A reasonable maximum exposure (RME) scenario, which represents the maximum exposure that is reasonably likely to occur, was calculated using the 95% UCL concentrations of COCs and a combination of the mean and upper-bound exposure parameters over an appropriate exposure area.

4.0 TOXICITY ASSESSMENT

The toxicity assessment provides a framework for characterizing the relationship between the magnitude of exposure to a COC and the nature and likelihood of adverse health effects that may result from such exposure. In an HHRA, chemical toxicity is typically divided into two categories: carcinogenic and non-carcinogenic effects. Potential health effects are evaluated separately for these two categories, because their toxicity criteria are based on different mechanistic assumptions and associated risks are expressed in different units. Provided in this subsection is an overview of the methodology that was used to develop a toxicity assessment as part of the HHRA for the Facility.

4.1 SOURCES OF TOXICITY INFORMATION

Pertinent toxicological and dose-response information for COCs were selected from the following sources in order of preference, in accordance with USEPA guidance (USEPA, 2003):

- Tier 1 – Integrated Risk Information System (IRIS), available on-line (USEPA, 2005)
- Tier 2 – USEPA's Provisional Peer-Reviewed Toxicity Values (PPRTVs)
- Tier 3 – Other Toxicity Values (e.g., California Environmental Protection Agency, The Agency for Toxic Substances and Disease Registry, and USEPA's Health Effects Assessment Summary Tables [USEPA, 1997]).

4.2 METHODOLOGY FOR EVALUATING CARCINOGENIC EFFECTS

For purposes of assessing risks for potential carcinogens, USEPA has adopted the science policy position of "no-threshold," i.e., there is essentially no level of exposure to a carcinogen that will not result in some finite possibility of tumor formation. This approach requires the development of dose-response curves correlating risks associated with given levels of exposure. Linear dose-risk response curves are generally assumed.

Carcinogenic risks associated with a given level of exposure to potential carcinogens are typically extrapolated based on slope factors (SFs) or unit risks. SFs are the upper 95% confidence limit of the slope of the dose-response curve, expressed in terms of risk per unit dose (given in $[mg/kg\text{-}day]^{-1}$). Unit risks relate the risk of cancer development with the concentration of a carcinogen in the given environmental medium, expressed as either risk per unit concentration in air (given in $[\mu g/m^3]^{-1}$) or drinking water (given in $[\mu g/L]^{-1}$).

Current USEPA guidance for calculating a dermal SF is to adjust the oral SF with an oral absorption factor specific for that chemical. It should be noted that the oral absorption factor used in the calculation refers to absorption of the chemicals in the species upon which the SF is based; i.e., generally not absorption data in humans.

The equation for extrapolation of a default dermal SF is as follows:

$$\textit{Default Dermal SF}\left([mg/kg\text{-}day]^{-1}\right) = \textit{Oral SF}\left([mg/kg\text{-}day]^{-1}\right) \div \textit{Oral Absorption Factor}\,(\%)$$

4.3 METHODOLOGY FOR EVALUATING NON-CARCINOGENIC EFFECTS

The USEPA has adopted the science policy position that protective mechanisms (such as repair, detoxification, and compensation) must be overcome before the adverse systemic health effect is manifested. Therefore, a range of exposures exists from zero to some finite value that can be tolerated by the organism without appreciable risk of expressing adverse effects.

The approach used by the USEPA to gauge potential non-carcinogenic effects is to identify the upper boundary of the tolerance range (threshold) for each chemical and to derive an estimate of the exposure below which adverse health effects are not expected to occur. Such an estimate calculated for the oral route of exposure is an oral reference dose (RfD), and for the inhalation route of exposure is an inhalation reference concentration (RfC). The oral RfD is typically expressed as mg chemical per kg body weight per day (mg/kg-day), and the inhalation RfC is usually expressed in terms of concentration in the air (i.e., mg chemical per m^3 of air). However, for purposes of the Facility-specific HHRA, inhalation RfC values can be converted to units of dose by multiplying by the inhalation rate (20 m^3/day, an upper-bound estimate for combined indoor-outdoor activity) and dividing by the body weight (70 kg, average body weight), as detailed in the following equation:

$$\textit{Inhalation RfD}\,(\textit{mg/kg - day}) = \textit{RfC}\,(\textit{mg/m}^3) \times 20\ \textit{m}^3\textit{/day} \div 70\ \textit{kg}$$

Currently, two types of oral RfDs/inhalation RfCs are available from the USEPA, depending on the length of exposure being evaluated, chronic and subchronic. Chronic oral RfDs/inhalation RfCs are specifically developed to be protective for long-term exposure to a chemical, and are generally used to evaluate the non-carcinogenic effects associated with exposure periods between seven years (approximately 10 percent of a human lifetime) and lifetime. Subchronic oral RfDs/inhalation RfCs are useful for characterizing potential non-carcinogenic effects associated with shorter-term exposures. Current USEPA guideline requires that subchronic oral RfDs/inhalation RfCs be used to evaluate the potential non-carcinogenic effects of exposure periods between two weeks and seven years (USEPA, 1989).

Toxicological criteria specifically derived for gauging potential human health effects associated with the dermal route of exposure have not been developed by USEPA. For purposes of the HHRA, default dermal RfD values will be extrapolated from oral RfDs in accordance with the current USEPA guidance (USEPA, 1989), if:

- Health effects following exposure are not route-specific.
- Portal-of-entry effects (e.g., dermatitis associated with dermal exposure and respiratory effects associated with inhalation exposure) are not the principal effects of concern.

Exposures with the dermal route are generally calculated as absorbed doses, while oral RfDs are expressed as administered doses. Therefore, adjustments are necessary to match the dermal exposure estimates with the oral RfDs. Current USEPA guidance is to adjust the oral RfD with oral absorption factor (i.e., percent chemical that is absorbed) to extrapolate a default dermal RfD (USEPA, 1989; USEPA 2004a). It should be noted that the oral absorption factor used in the calculation refers to absorption of the chemicals in the species upon which the reference dose is based; (i.e., generally not absorption data in humans).

The equation for extrapolation of a default RfD is as follows:

$$\textit{Dermal RfD}\,(\textit{mg/kg - day}) = \textit{Oral RfD}\,(\textit{mg/kg - day}) \times \textit{Oral Absorption Factor}\,(\%)$$

5.0 RISK CHARACTERIZATION

In this step of the HHRA, information obtained from the exposure and toxicity assessments were integrated to characterize the potential risks posed by COCs selected for the HHRA.

5.1 RISK FOR INDIVIDUAL COCs

The methods that were used for characterizing risk potentially associated with exposure to individual COCs are briefly outlined as follows:

5.1.1 Carcinogenic Effects

Potential risks for carcinogenic effects are typically estimated by calculating incremental lifetime cancer risk (CR) as a result of exposure to carcinogens. Calculation of a CR for an exposure pathway involves multiplying the chronic daily intake for each chemical by its upper-bound cancer slope factor, as described by the following equation (USEPA, 1989):

$$CR = CDI \times SF$$

Where:

CR	=	Cancer risk (unitless).
CDI	=	Chronic daily intake of chemicals (expressed in mg/kg-day);
SF	=	Slope factor (expressed in $[mg/kg\text{-}day]^{-1}$); Chemical-specific SF values were used in the calculation if available, values extrapolated from a surrogate were used, if appropriate.

For known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper-bound lifetime CR to an individual of between one in ten thousand (10^{-4}) and one in a million (10^{-6}).

5.1.2 Noncarcinogenic Effects

Potential risks for noncarcinogenic effects are typically estimated by calculating the hazard quotient (HQ) for each COC, using the following equation:

$$HQ = \frac{CDI}{RfD}$$

Where:

HQ	=	Hazard quotient (unitless).
CDI	=	Chronic daily intake of chemicals (expressed in mg/kg-day).
RfD	=	Reference dose (expressed in mg/kg-day); chemical-specific RfD values will be used in the calculation if available, values extrapolated from a surrogate will be used, if appropriate.

5.2 RISK FOR CUMULATIVE COCs

The methodology used for characterizing potential risk for exposures to multiple chemicals is briefly outlined as follows:

1. Organize outputs of exposure and toxicity assessments by the duration and route of exposure for each receptor population.

   The total upper-bound excess lifetime CRs and the HQs were tabulated separately for each COC.

2. Quantify total carcinogenic and noncarcinogenic risks for each pathway by summing the risks estimated for each COC.

   The total upper-bound excess lifetime CR for each pathway was obtained by summing CRs calculated for individual COCs. For known or suspected carcinogens, exposure levels that represent an excess upper-bound lifetime cancer risk to an individual greater than 10^{-6} are addressed as outlined in Section 1.2 of this appendix and the Hazardous Waste Permit for the Facility (UDEQ, 1997).

   The sum of the HQs of all COCs under consideration is termed the HI. The HI is a useful reference point for gauging the potential noncarcinogenic effects of environmental exposures to complex exposures. In general, an HI that is less than or equal to one is regarded as not likely to be associated with any health risks, and is, therefore, less likely to be of regulatory concern as compared to hazard indices greater than one. However, a conclusion should not be categorically drawn that all HI's greater than one are "unacceptable" because of the following reasons:

   ⇒ There is perhaps one order of magnitude or greater uncertainty inherent in estimates of oral RfDs and inhalation RfCs due to the conservative approach used to derive these estimates.

   ⇒ There are uncertainties related to the assumption that individual HQ's are additive.

   Therefore, if the HI exceeds one, the HI will be re-calculated by segregating the chemicals into subgroups based on the target organs affected and the mechanism of action. However, for this HHRA this step was unnecessary because the HI is considerably less than 1.

3. Estimate overall risks that affect each population over the same time period by combining risks across pathways.

   Risks were combined across different pathways that are likely to affect the same population over the same time periods to address the possibility of a population that is exposed to more than one pathway.

Table D-6 to D-8 present the risk calculations for the construction worker potentially exposed to B(a)P and D(a,h)A in soil, PCE in soil, and PCE in groundwater, respectively.

6.0 UNCERTAINTY ANALYSIS

The objective of conducting an uncertainty analysis is to evaluate the assumptions and uncertainties inherent in the HHRA to place the results of the risk estimate in proper perspective. Presented below are the types of uncertainties that were evaluated in the HHRA report.

6.1 DATA EVALUATION

Uncertainties associated with the data validation process are discussed to identify key issues, if any, that contribute most to the overall quality of the analytical data evaluated in the HHRA.

The QA/QC review (Appendix B) indicated that the data are acceptable for the purpose of evaluating potential impacts of tetrachloroethene in soil and groundwater at this site.

6.2 EXPOSURE ASSESSMENT

Uncertainties associated with the findings of the exposure assessment may result from several sources. For this Facility, exposure assessment uncertainties include:

- Groundwater samples were collected as grab samples. Therefore, the concentrations of chemicals in these samples are expected to be higher than concentrations found in developed monitoring wells. The use of grab sample data is likely to result in an overestimate of risks potentially posed by PCE in groundwater.
- The use of the maximum detected concentration of PCE in groundwater to estimate construction worker risk. This is a conservative approach because the concentration of groundwater construction workers might contact could be significantly lower than the maximum concentration because PCE was a COC for SWMU 7 only. It was nondetect or present at low levels at the remaining Facility SWMUs.
- Conservative assumptions regarding exposure scenarios (e.g., land use, exposed populations, activity patterns) for the construction worker exposed to groundwater. The Soil and Water Management Plan (SWMP) implemented by Ashland for the Facility defines the required work practices to be used to minimize exposure if groundwater is encountered during excavation activities. Although the SWMP ensures that construction workers would not contact groundwater, this pathway was quantified for an informational purpose.
- Applicability and assumptions of models selected to predict the fate and transport of COCs in the environment. For this HHRA, it was conservatively assumed that chemicals present in soil and groundwater did not undergo biodegradation and natural attenuation.
- Exposure parameters for estimating intake of COCs in soil and groundwater were mostly default values recommended by USEPA and most likely overestimate the actual exposures for construction workers at the site.

6.3 TOXICITY ASSESSMENT

The following sources of uncertainties associated with the results of a toxicity assessment:

- Uncertainty inherent in the standard risk evaluation process, e.g., the default approach for deriving dermal toxicity criteria. Currently there are no toxicity values available to evaluate the dermal exposure pathway. Therefore, oral RfDs and oral SFs are used to assess systemic toxicity from dermal exposures. When oral toxicity values for systemic effects are applied to dermal exposures, uncertainty in the risk assessment is introduced because differences in the mechanisms of action between the oral and dermal exposures are not taken into account. Use of oral toxicity factors can result in the over- or underestimation of risk, depending on the chemical. It is not possible to make a general statement about the direction or magnitude of this uncertainty.
- Uncertainty common to current agency guidance on the risk evaluation, e.g., the use of animal data to extrapolate toxicity values necessary for estimating risk for human receptors.

6.4 RISK CHARACTERIZATION

Level of confidence in the results of the risk characterization were analyzed in light of uncertainties associated with the data validation, exposure assessment and toxicity assessment in an attempt to identify the following:

- Major COCs and pathways driving the risks
- Major factors that may reduce the uncertainty associated with the results of the risk characterization

The overall confidence of the conclusions made for this Facility-specific HHRA is high because the approach used to select EPCs, exposure pathways, and exposure parameters used to estimate risk and hazard are inherently conservative and are not likely to underestimate risk to receptors potentially exposed to chemicals in soil and groundwater at the Facility.

Notes:

Derm - HQ – Dermal Hazard Quotient
Csoil – Concentration in Soil
EF – Exposure Frequency
ED – Exposure Duration
EV – Event Frequency
SA – Skin Surface Area
SSAF – Soil-to-skin Adherence Factor
ABSd – Dermal Soil Absorption Factor
BW – Body Weight
ATn – Averaging Time for Noncarcinogens
RfDabs – Absorbed reference dose (RfDo ×ABSgi)
NA – Not Applicable

Table D-6.4a
Risk Calculations
Construction Worker: Incidental Inhalation of Soil (Fugitive Emissions and Volatile Compounds) Pathway– Carcinogenic Effects
Ashland – Clearfield, Utah

$$\text{Inh - Risk} = \frac{(\text{Csoil} \times \text{SFi} \times \text{IR} \times \text{EF} \times \text{ED} \times [(1/\text{VF}) + (1/\text{PEF})])}{(\text{BW} \times \text{ATc})}$$

Equation	Inh - Risk	= (	Csoil	×	SFi	×	IR	×	EF	×	ED	×	[	1	/	VF	+	1	/	PEF	]	)	÷	(	BW	×	ATc	)
Units	unitless		mg/kg		kg-day/mg		m³/day		days/year		year					m³/kg				m³/kg					kg		days	
Benzo(a)pyrene	1.13E-11	= (	9.30E-01	×	3.08E+00	×	20	×	20	×	1	×	[	1	/	NA	+	1	/	5.67E+07	]	)	÷	(	70	×	25,550	)
Dibenzo(a,h)anthracene	NA	= (	3.25E-01	×	NV	×	20	×	20	×	1	×	[	1	/	NA	+	1	/	5.67E+07	]	)	÷	(	70	×	25,550	)

Notes:

Inh - Risk – Inhalation Risk
Csoil – Concentration in Soil
SFi – Inhalation Slope Factor
IR – Inhalation Rate
EF – Exposure frequency
ED – Exposure duration
VF – Volatilization Factor
PEF – Particulate Emission Factor
BW – Body Weight
ATc – Averaging Time for Carcinogens
NV – No toxicity value available for this pathway.

Table D-6.4b
Risk Calculations
Construction Worker: Incidental Inhalation of Soil (Fugitive Emissions and Volatile Compounds) Pathway – Carcinogenic Effects
Ashland – Clearfield, Utah

$$\text{Inh - HQ} = \frac{(\text{Csoil} \times \text{IR} \times \text{EF} \times \text{ED} \times ([1/\text{VF}] + [1/\text{PEF}]))}{(\text{BW} \times \text{ATn} \times \text{RfDi})}$$

Equation	Inh - HQ	= (	Csoil	×	IR	×	EF	×	ED	× [	1	/	VF	+	1	/	PEF	] ÷ (	BW	×	ATn	×	RfDi	)
Units	unitless		mg/kg		m³/day		days/year		year				m³/kg				m³/kg		kg		days		mg/kg-day	
Benzo(a)pyrene	NA	= (	9.30E-01	×	20	×	20	×	1	× [	1	/	NA	+	1	/	5.67E+07	] ÷ (	70	×	365	×	1.30E-01	)
Dibenzo(a,h)anthracene	NA	= (	3.25E-01	×	20	×	20	×	1	× [	1	/	NA	+	1	/	5.67E+07	] ÷ (	70	×	365	×	1.30E-01	)

Notes:

Inh - Risk – Inhalation Hazard Quotient
Csoil – Concentration in Soil
IR – Inhalation Rate
EF – Exposure frequency
ED – Exposure duration
VF – Volatilization Factor
PEF – Particulate Emission Factor
RfDi – Inhalation Reference Dose
BW – Body Weight
ATn – Averaging Time for Noncarcinogens
NV – No toxicity value available for this pathway.
NA – Not Applicable

Table D-6.4c
Construction Worker: Particulate Emission Factor Calculations
Ashland – Clearfield, Utah

$$PEF_{sc} = Q/C_{sr} \times \frac{1}{F_D} \times \left[\frac{T \times A_g}{556 \times \left(\frac{w}{3}\right) \times p \times \Sigma VKT} \right]$$

PEF_{sc} – Subchronic road particulate emission factor

Q/C_{sr} – Inverse of a 1-hour average air concentrations along a straight road segment

F_D – Dispersion correction factor (unitless)

T – Total time over which construction occurs (in seconds), 960 hrs x 60 min/hr x 60 sec/min = 3.46E+06 sec

A_R – Surface area of contaminated road segment (m^2)

0.826443 acres x (4,048 m^2/acre) = 3345.44 m^2. The square root of 3345.44 m^2 is 57.84 m
Assuming the road is 57.84 m (189.76 ft) long and 16 ft wide

$A_R = L_R \times W_R \times 0.092903\ m^2/ft^2$

W – Mean vehicle weight, where:

W = 40 tons

p – Percentage of days with at least 0.01 inches of precipitation, minimum of 80 days/yr for Salt Lake City, based on Exhibit 5-2 (70/365 = 0.19).

ΣVKT – Sum of fleet vehicle traveled during the exposure duration (kilometers), assuming all trucks travel once a day, where:

ΣVKT = 1 vehicles x 1.4 km/day x (2 wks/yr ÷ 2) x 5 days/wk
= 7

Equation	PEF_{sc}	=	Q/C_{sr}	× [1 ÷	F_D	] × { (	T	×	A_R	) ÷ [	556	× (	W	/ 3) $^{0.4}$	×	*p*	× ΣVKT] }
Units	m^3/kg		g/m^2-s per kg/m^3		unitless		s		m^2				tons				km
All Chemicals	5.67E+07	=	23.02	× [1 ÷	0.19	] × { (	3.46E+06	×	2.82E+02	) ÷ [	556	× (	40	/ 3) $^{0.4}$	×	0.19	× 7] }

Default values are as presented in Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA 2002a).

CALCULATION OF SURFACE AREA OF CONTAMINATED ROAD SEGMENTS (A_R)

A_R	=	L_R	×	W_R	×	0.092903
m^2		ft		ft		m^2/ft^2
2.82E+02	=	189.76	×	16	×	0.092903

where:

A_R = Surface area of contaminated road segment (m^2)

L_R = Length of road segment (ft)

L_R = square root of site surface contamination (0.826443 acres)

= (4,048 m^2/acre x 0.826443 acres = (3345.44 m^2)$^{1/2}$ = 57.84 m = 1.89.76 ft

W_R = Width of road segment (ft)

Table D-6.4d
Construction Worker: Dispersion Correction Factor Calculations
Ashland – Clearfield, Utah

Equation:

$$F_D = 0.1852 + \frac{5.3537}{t_c} + \frac{-9.6318}{t_c^2}$$

F_D = Dispersion correction factor (unitless)
t_c = Duration of construction (hr), estimated using the following equation:
t_c = (8 hrs/workday) × (20 workdays/month) × 6 months = 960 hrs

F_D	=	0.1852	+ (	5.3537	÷	t_c hours	) + ((	- 9.6318	) ÷ (	t_c hours	) ^{2})
0.19	=	0.1852	+ (	5.3537	÷	960	) + ((	- 9.6318	) ÷ (	960	) ^{2})

Construction Worker: Incidental Dermal Contact with Soil Pathway – Carcinogenic Effects
Ashland – Clearfield, Utah

$$\text{Derm - Risk} = \frac{(\text{Csoil} \times \text{SFabs} \times \text{CF} \times \text{EF} \times \text{ED} \times \text{EV} \times \text{SA} \times \text{SSAF} \times \text{ABSd})}{(\text{BW} \times \text{ATc})}$$

Equation	Derm - Risk = (	Csoil	×	SFabs	×	CF	×	EF	×	ED	×	EV	×	SA	×	SSAF	×	ABSd	) ÷ (	BW	×	ATc	)
Units	unitless	mg/kg		kg-day/mg		kg/mg		days/year		years		events/day		cm²		mg/cm²-event		unitless		kg		days	
Tetrachloroethene	NA	= (1.94E-01	×	5.20E-02	×	1E-06	×	20	×	1	×	1	×	3,300	×	0.3	×	NA	) ÷ (	70	×	25,550	)

Notes:

Derm - Risk – Dermal Risk
Csoil – Concentration in Soil
SFabs – Absorbed slope factor (SFo ÷ABSgi)
CF – Conversion factor
EF – Exposure Frequency
ED – Exposure Duration
EV – Event Frequency
SA – Skin Surface Area
SSAF – Soil-to-skin Adherence Factor
ABSd – Dermal Soil Absorption Factor
BW – Body Weight
ATc – Averaging Time for Carcinogens
NA – Not Applicable

Table D-7.3b
Risk Calculations
Construction Worker: Incidental Dermal Contact with Soil Pathway – Noncarcinogenic Effects
Ashland – Clearfield, Utah

$$\text{Derm - HQ} = \frac{(\text{Csoil} \times \text{EF} \times \text{EF} \times \text{ED} \times \text{EV} \times \text{SA} \times \text{SSAF} \times \text{ABSd})}{(\text{BW} \times \text{ATn} \times \text{RfDabs})}$$

Equation	Derm - HQ	= (	Csoil	×	CF	×	EF	×	ED	×	EV	×	SA	×	SSAF	×	ABSd	) ÷ (	BW	×	ATn	×	RfDabs	)
Units	unitless		mg/kg		kg/mg		days/year		years		events/day		cm^2		mg/cm^2-event		unitless		kg		days		mg/kg-day	
Tetrachloroethene	NA	= (	1.94E-01	×	1E-06	×	20	×	1	×	1	×	3,300	×	0.3	×	NA	) ÷ (	70	×	365	×	1.00E-02	)

Notes:

Derm - HQ – Dermal Hazard Quotient
Csoil – Concentration in Soil
EF – Exposure Frequency
ED – Exposure Duration
EV – Event Frequency
SA – Skin Surface Area
SSAF – Soil-to-skin Adherence Factor
ABSd – Dermal Soil Absorption Factor
BW – Body Weight
ATn – Averaging Time for Noncarcinogens
RfDabs – Absorbed reference dose (RfDo ×ABSgi)
NA – Not Applicable

Table D-7.4a
Risk Calculations
Construction Worker: Incidental Inhalation of Soil (Fugitive Emissions and Volatile Compounds) Pathway– Carcinogenic Effects
Ashland – Clearfield, Utah

$$\text{Inh - Risk} = \frac{(\text{Csoil} \times \text{SFi} \times \text{IR} \times \text{EF} \times \text{ED} \times [(1/\text{VF}) + (1/\text{PEF})])}{(\text{BW} \times \text{ATc})}$$

Equation	Inh - Risk	= (	Csoil	×	SFi	×	IR	×	EF	×	ED	× [	1	/	VF	+	1	/	PEF	]) ÷ (	BW	×	ATc	)
Units	unitless		mg/kg		kg-day/mg		m³/day		days/year		year				m³/kg				m³/kg		kg		days	
Tetrachloroethene	1.68E-08	= (	1.94E-01	×	2.03E-03	×	20	×	20	×	1	× [	1	/	5.24E+00	+	1	/	1.60E+08	]) ÷ (	70	×	25,550	)

Notes:

Inh - Risk – Inhalation Risk
Csoil – Concentration in Soil
SFi – Inhalation Slope Factor
IR – Inhalation Rate
EF – Exposure frequency
ED – Exposure duration
VF – Volatilization Factor
PEF – Particulate Emission Factor
BW – Body Weight
ATc – Averaging Time for Carcinogens

Table D-7.4b
Risk Calculations
Construction Worker: Incidental Inhalation of Soil (Fugitive Emissions and Volatile Compounds) Pathway – Carcinogenic Effects
Ashland – Clearfield, Utah

$$\text{Inh - HQ} = \frac{(\text{Csoil} \times \text{IR} \times \text{EF} \times \text{ED} \times ([1/\text{VF}] + [1/\text{PEF}]))}{(\text{BW} \times \text{ATn} \times \text{RfDi})}$$

Equation	Inh - HQ	= (	Csoil	×	IR	×	EF	×	ED	× [	1	/	VF	+	1	/	PEF	]) ÷ (	BW	×	ATn	×	RfDi	)
Units	unitless		mg/kg		m³/day		days/year		year				m³/kg				m³/kg		kg		days		mg/kg-day	
Tetrachloroethene	3.39E-03	= (	1.94E-01	×	20	×	20	×	1	× [	1	/	5.24E+00	+	1	/	1.60E+08	]) ÷ (	70	×	365	×	1.71E-01	)

Notes:

Inh - Risk – Inhalation Hazard Qubtient
Csoil – Concentration in Soil
IR – Inhalation Rate
EF – Exposure frequency
ED – Exposure duration
ET – Exposure Time
VF – Volatilization Factor
PEF – Particulate Emission Factor
RfDi – Inhalation Reference Dose
BW – Body Weight
ATn – Averaging Time for Noncarcinogens
NV – No toxicity value available for this pathway.
NA – Not Applicable

Table D-7.4c
Construction Worker: Volatilization Factor Calculations
Ashland – Clearfield, Utah

Equation:

$$VF_{sc} = \left[\frac{(3.14 \times D_A \times T)^{1/2}}{2 \times \rho_b \times D_A}\right] \times 10^{-4}\, m^2/cm^2 \times Q/C_{sa} \times \frac{1}{F_D}$$

Chemical	Q/C_{sa} $(g/m^2\text{-}s)/(kg/m^3)$	π	D_A (cm^2/s)	T (s)	2	ρb (g/cm^3)	10^{-4} (m^2/cm^2)	$1/F_D$ unitless	VF (m^3/kg)
Tetrachloroethene	13.01	3.14	4.69E-03	1.73E+06	2	1.5	1.00E-04	5.24E+00	2.14E-03

Notes: Default values are as presented in Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA 2002a).

VF – Volatilization Factor (m^3/kg) (calculated)
π – pi (3.14)
DA – Apparent Diffusivity (cm^2/s)
T – Exposure interval (s)
ρb – Dry soil bulk density (g/cm^3) (site-specific value)

$$Q/C_{sa} = A \times \exp\left[\frac{(\ln A_c - B)^2}{C}\right]$$

Q/C_{sa} – Inverse of the ratio of the 1-h. geometric mean air concentration and the volatilization flux at the center of a square emission source (g/m^2-s per kg/m^3)
A – 2.4538
B – 17.566
C – 189.0426
A_c – Areal extent of site soil contamination (36,000 sq ft or 0.826443 acres).

Equation	Q/C_{sa}	=	A	$ln\, A_c$	B	C
Units	$(g/m^2$-s per $kg/m^3)$			acres		
All Chemicals	13.01	=	2.4538	0.826443	17.57	189.0426

Table D-7.4d
Construction Worker: Apparent Diffusivity Calculations
Ashland – Clearfield, Utah

Equation:

$$D_A = \frac{\left(\theta_a^{3.33} \times D_i \times H'\right) + \left(\theta_w^{3.33} \times D_w\right)}{\eta^2} \times \frac{1}{\left(\rho_b \times K_d\right) + \theta_w + \left(\theta_a \times H'\right)}$$

Chemical Units	θ_a (Lair /Lsoil)	D_i (cm^2/s)	H' unitless	θ_w (Lwater /Lsoil)	D_w (cm^2/s)	η (Lpore /Lsoil)	ρ_b (g/cm^3)	ρ_s (g/cm^3)	K_{oc} (cm^3/g)	K_d (cm^3/g)	D_A (cm^2/s)	Source		
												D_i	D_w	K_{oc}
Tetrachloroethene	2.84E-01	7.20E-02	7.54E-01	0.15	8.20E-06	4.34E-01	1.5	2.65	1.55E+02	9.30E-01	4.69E-03	ORNL	SSL	SSL

D_A – apparent diffusivity
θ_a – air-filled soil porosity
D_i – diffusivity in air
H' – dimensionless Henry's law constant
θ_w – water-filled soil porosity
D_w – diffusivity in water
η – total soil porosity
ρ_b – dry soil bulk density
ρ_s – soil particle density
K_d – soil-water partition coefficient, where:
$K_d = K_{oc} \times f_{oc}$
K_{oc} – soil organic carbon partition coefficient (cm^3/g)
f_{oc} – fraction organic carbon in soil (g/g) (A default value of 0.006 g/g was used.)
ORNL – Oak Ridge National Laboratory Risk Assessment Information System http://risk.lsd.ornl.gov/cgi-bin/tox/TOX_select?select=csf
SSL – Supplemental Guidance for Developing Soil Screening Levels For Superfund Sites (USEPA, 2002a)

Table D-7.4e
Construction Worker: Particulate Emission Factor Calculations
Ashland – Clearfield, Utah

$$PEF_{sc} = Q/C_{sr} \times \frac{1}{F_D} \times \left[\frac{T \times A_R}{556 \times \left(\frac{W}{3}\right)^{0.4} \times p \times \Sigma VKT} \right]$$

PEF_{sc} – Subchronic road particulate emission factor

Q/C_{sr} – Inverse of a 1-hour average air concentrations along a straight road segment

F_D – Dispersion correction factor (unitless)

T – Total time over which construction occurs (in seconds), 960 hrs x 60 min/hr x 60 sec/min = 3.46E+06 sec

A_R – Surface area of contaminated road segment (m^2)

6.5 acres × (4,048 m^2/acre) = 26,304.36 m^2. The square root of 2,025,000 m^2 is 162.21 m
Assuming the road is 162.19 m (535.29 ft) long and 16 ft wide
$A_R = L_R \times W_R \times 0.092903\ m^2/ft^2$

W – Mean vehicle weight, where:
W = 40 tons

p – Percentage of days with at least 0.01 inches of precipitation, minimum of 80 days/yr for Salt Lake City, based on Exhibit 5-2 (70/365 = 0.19).

ΣVKT – Sum of fleet vehicle traveled during the exposure duration (kilometers), assuming all trucks travel once a day, where:
ΣVKT = 1 vehicles × 1.4 km/day × (2 wks/yr ÷ 2) × 5 days/wk
= 7

Equation	PEF_{sc}	=	Q/C_{sr}	× [1 ÷	F_D	] × [(	T	×	A_R	) ÷ [556 × (W / 3)$^{0.4}$ ×	p	× ΣVKT]]
Units	m^3/kg		g/m^2-s per kg/m^3		unitless		s		m^2	tons		km
All Chemicals	1.60E+08	=	23.02	× [1 ÷	0.19	] × [(	3.46E+06	×	7.96E+02	) ÷ [556 × (40 / 3)$^{0.4}$ ×	0.19	× 7]]

Default values are as presented in Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA 2002).

CALCULATION OF SURFACE AREA OF CONTAMINATED ROAD SEGMENTS (A_R)

A_R	=	L_R	×	W_R	×	0.092903
m^2		ft		ft		m^2/ft^2
7.96E+02	=	535.29	×	16	×	0.092903

where:

A_R = Surface area of contaminated road segment (m^2)

L_R = Length of road segment (ft)

L_R = square root of site surface contamination (6.5 acres)
= (4,048 m^2/acre × 6.5 acres = (2.63E+04 m^2)$^{1/2}$ = 162.21 m = 535.29 ft

W_R = Width of road segment (ft)

Table D-7.4f
Construction Worker: Dispersion Correction Factor Calculations
Ashland – Clearfield, Utah

Equation:

$$F_D = 0.1852 + \frac{5.3537}{t_c} + \frac{-9.6318}{t_c^2}$$

F_D = Dispersion correction factor (unitless)
t_c = Duration of construction (hr), estimated using the following equation:
t_c = (8 hrs/workday) × (20 workdays/month) × 6 months = 960 hrs

F_D	=	0.1852	+	(	5.3537	÷	t_c hours	)	+	((	-	9.6318	)	÷	(	t_c hours	)	^{2})
0.19	=	0.1852	+	(	5.3537	÷	960	)	+	((	-	9.6318	)	÷	(	960	)	^{2})

Table D-8.1
Construction Worker: Water Pathway Exposure Parameter Values
Ashland – Clearfield, Utah

Exposure Pathway	Parameter	Description	Construction Worker	
			RME	Source
Incidental Ground Water Ingestion	WIR	Ground Water Ingestion Rate (L/day)	0.024	(a)
	EF	Exposure Frequency (d/yr)	20	(b)
	ED	Exposure Duration (years)	1	(c)
	ET	Exposure Time (hours/event)	0.5	(b)
	BW	Body Weight (kg)	70	(d,f)
	AT_n	Averaging Time Noncarcinogens (days)	365	(e)
	AT_c	Averaging Time Carcinogens (days)	25,550	(d,f)
Dermal Contact with Ground Water	SA	Skin Surface Area Exposed (cm^2)	3,300	(g)
	EF	Exposure Frequency (d/yr)	20	(b)
	ED	Exposure Duration (years)	1	(c)
	EV	Event Frequency	1	(f)
	ET	Exposure Time (hours/event)	0.5	(b)
	BW	Body Weight (kg)	70	(d,f)
	AT_n	Averaging Time Noncarcinogens (days)	365	(e)
	AT_c	Averaging Time Carcinogens (days) (l)	25,550	(d,f)

Notes:
RME - Reasonable Maximum Exposure.
(a) USEPA, 1989. Risk Assessment Guidance for Superfund, Volume I. Value is one-fiftieth of that assumed to occur during a swimming event.
(b) Site-specific value. It is assumed that excavation activities would take 20 days to complete.
(c) Construction activities area assumed to occur over a 1 year period.
(d) USEPA, 1989. Risk Assessment Guidance for Superfund, Volume I (Part A).
(e) The averaging time for noncarcinogens is equal to the Exposure Duration (in yrs) × 365 day/yr (US EPA, 1989).
(f) 70 year lifetime is used to be consistent with the development of cancer slope factors.
(g) USEPA, 2004. Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment). Exhibit 3-5. Skin surface area available for contact for industrial workers.

Table D-8.2a
Risk Calculations
Construction Worker: Incidental Ingestion of Groundwater Pathway – Carcinogenic Effects
Ashland – Clearfield, Utah

$$\text{Ing-Risk} = \frac{(\text{Cwater} \times \text{WIR} \times \text{EF} \times \text{ED} \times \text{SFo})}{(\text{BW} \times \text{ATc})}$$

Equation	Ing - Risk	= (	Cwater	×	WIR	×	EF	×	ED	×	SFo	) ÷ (	BW	×	ATc	)
Units	unitless		mg/L		L/day		days/year		years		kg-day/mg		kg		days	
Tetrachloroethene	8.51E-11	= (	6.10E-03	×	2.40E-02	×	20	×	1	×	5.20E-02	) ÷ (	70	×	25,550	)

Notes:

Ing-Risk – Carcinogenic Risk Water Ingestion Pathway
Cwater – Concentration in Water
WIR – Water Ingestion Rate
EF – Exposure Frequency
ED – Exposure Duration
SFo – Oral Slope Factor
BW – Body Weight
ATc – Averaging Time for Carcinogens

Table D-8.2b
